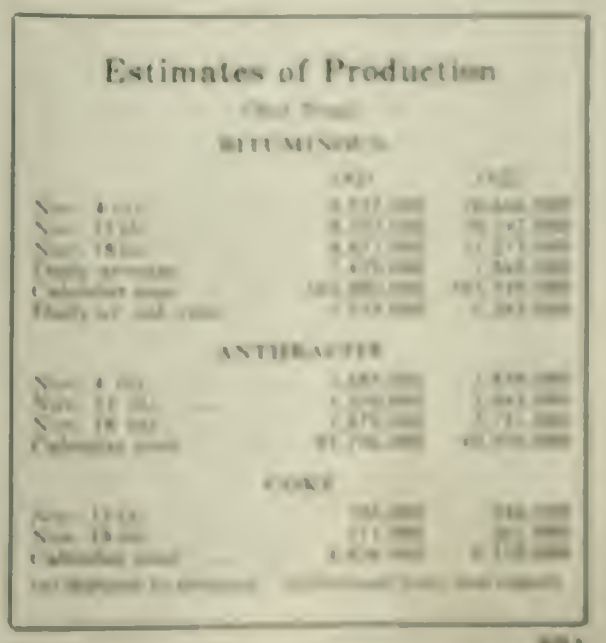
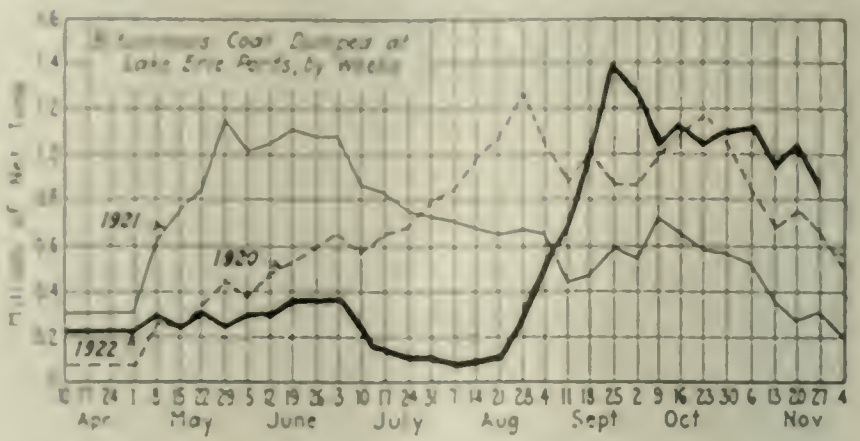
Sellers at the Cincinnati gateway report more diversified conditions. Stodgy Northern demand is turning a larger tonnage south from the Virginia and the southeastern Kentucky fields. Low-volatile agencies are again soliciting orders, quoting reduced figures for early December business.



In the Middle West screenings are finding a better market. This is due not so much to improved demand as to lowered production. Domestic grades are in a slump and curtailed operation is reducing the available supply of fine coal.

Transportation conditions are improving. The car supply, however, is so erratic that individual shortages at the mines complicate the market. The uncertainty of the car supply is so great that producers cannot gage their offerings; spot coal, like the demand, therefore is on a day-to-day basis in most sections.

The scarcity of domestic anthracite has become pronounced and with the advent of colder weather more substitutes are being sold. Independent prices have advanced with the shortage. Eastern markets have been promised early relief, as companies will soon divert more domestic tonnage in that direction with the closing of the Lakes. In the meantime these markets are being invaded by prepared sizes of bituminous coal and, once having gained a foothold, soft coal will make some permanent inroad on what has heretofore been an inviolable stronghold for the producers of domestic anthracite.



Lower weather has injected some life into the anthracite steam market, but the supply still exceeds the demand and one company has reduced its circular prices to clear the tidewater supply. Buckwheat is in the best position, as many producers insist on a proportionate amount of this size being taken with an order for domestic coal.

The Lake movement is slowing down. Last week's clearings of anthracite at Buffalo amounted to 110,103 net tons, as compared with 151,450 tons in the preceding week. The Northwest's supply by Lakes will not exceed 46 per cent of normal this year.

BITUMINOUS

"Bituminous coal production during the week ended Nov. 18 was 11,215,000 net tons, as against 10,147,000 tons in the week preceding," says the Geological Survey. "Early returns for last week (Nov. 20-25) indicate that 11,000,000 tons were raised. Both bituminous coal and anthracite output in the week ended Nov. 18 were at high rates, and the total coal raised, 13,403,000 net tons, was the highest weekly last turn since the strike and was exceeded this year only in the week ended March 25, when the total was 13,443,000 net tons."

The all-rail movement to New England amounted to 3,289 cars during the week ended Nov. 18, as compared with 3,329 cars in the previous week. Shipments for 1922 are now

21 per cent behind the corresponding period in 1921. Central Pennsylvania is getting into better position to ship to this territory, as the recent strength in prices at Hampton Roads has reduced the competitive advantage of these fuels. The car supply is uneven and keeps operators guessing

Coal Age Index 330, Week of Nov. 27, 1922. Average spot price for same period, $3.99. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared and run-of-mine normally shipped and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board.

as to whether to sell ahead at present prices or to take the market as they may find it. On the whole, however, orders are only slightly in excess of the current output. The resumption of work at the textile mills, now that the strike has been settled, is expected to increase the demand.

Hampton Roads dumpings were 211,415 net tons during the week ended Nov. 23, as compared with 202,000 tons in the preceding week. Coal on hand at the piers is increas-

ing very slowly, as cars are so short and Western points are taking a heavy tonnage. There is a scattering amount loaded on export, bunkers are holding their own and coast-

wise business takes the bulk of the tonnage, most of it now going to New England. New York is taking a minimum of the Southern coals, the great portion of it to contract.

Lake business is, of course, dwindling. Mines are discontinuing their shipments to the lower ports and another week should see the end. During the week ended Nov. 27 the lower ports dumped 812,117 net tons. The movement for the season to date now stands at 18,426,125 tons, as compared with 22,932,800 tons during the corresponding period of last year. Softness pervades the Northwestern bituminous-coal market. Prices are being hammered down, all-rail competition is keen and the supply is reassuring consumers who feel that lower prices may be their reward for further delay in placing orders.

ANTHRACITE

Production of hard coal last week was 2,100,000 net tons, as estimated from preliminary reports on hand at this writing. During the preceding week it was 2,181,000 tons, a record which has been exceeded only once in the last six years.

That there is need for record production is evidenced by a clamorous demand for domestic sizes. Turning their attention from the Lake market, producers now provide early relief for other sections.

Steam coals are still taboo-ed, although the mild weather has reduced the accumulations. One company, however, has found it necessary to reduce its prices circular 50c. to stimulate sales.

COKE

Production of beehive coke was 261,000 net tons during the week ended Nov. 18, as compared with 248,000 tons in the previous week.

The resumption of several blast furnaces has increased the demand for Connellsville furnace coke. More are planning to follow at once as enough coke is on hand to warrant it. Active consumers are ready to contract on old crop and as pig iron is in shipping there is considerable price resistance shown by prospective coke buyers.

Foreign Market And Export News

Rhondda Collieries Are Well-Booked

Coal Output continues to produce coal at record-breaking speed. The output during the week ended Nov. 11 was the heaviest of the year—[illegible] gross tons—according to a cable to *Coal Age*, and compares with [illegible] tons in the week preceding. The market is active, especially on the heavier steam sizes.

The condition of the Welsh export market is very satisfactory and the home trade shows some signs of revival. The market is awaiting the usual end-of-the-year contract inquiries and some good business has been done over 1923, including business with French railways, and in South American and Italian directions, and recently there have been inquiries from Egypt.

Many of the leading colliery owners are overbooked and out of the market. Foreign orders have been received from all the regular markets, and the fact that shipments to North America have declined to about 23,000 tons per week has not affected the position.

There has been a decided decline in nearly all values in Durham and Northumberland, and it would appear that the amount of coal available for this year is largely responsible for it, coupled with the general uncertainty of the position. At the same time, the collieries are heavily booked and sold out for December.

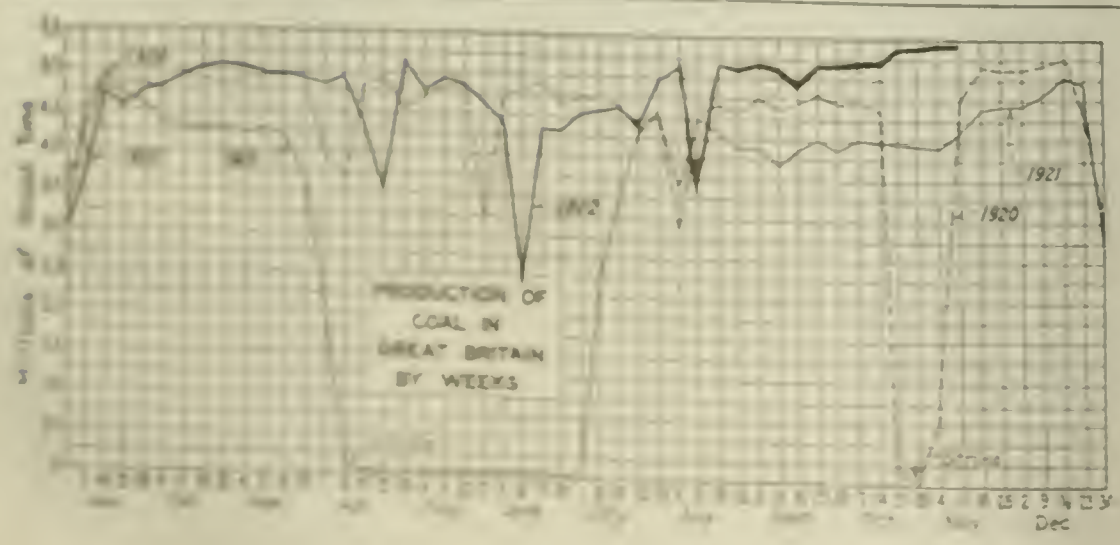
Continental inquiry tends to slow down, owing to the unsettled exchanges. France and Italy are taking fair quantities, but business with Scandinavian countries is quiet and Germany is sparing in her new demands. America is still in the market for occasional cargoes of steam and gas coal, and the Argentine and the East are also in evidence.

Hampton Roads Market Indifferent

Indifferent business causes prices to fluctuate slightly, arriving at the end of the week in the previous week's level and with dullness continuing to feature the market. The diversion of coal to the West continued to make itself felt on the trade here.

The situation had only one bright phase—the approach of cold weather, but the trade has not been stimulated

Germany Must Speed Up Production



The returns of September coal production have been watched with the greatest interest, in view of the re-establishment of overtime shifts, upon which great hopes for a material increase of the output had been staked. The Ruhr miners consented to work six hours per week in excess of the regulation working time in overtime shifts of two hours, three days a week. The result is so far strongly disappointing. The increase of output compared with August was in September only 7,000 tons per day instead of the 50,000 tons expected.

GERMAN COAL PRODUCTION
(METRIC TONS)

	First Nine Months of—		
	1922	1921	1913
[illegible]	[illegible]	100,602,000	130,177,000
[illegible]	[illegible]	90,922,000	64,132,000
Coke—	22,038,000	20,761,000	22,769,000
[illegible]	4,090,000	4,276,000	4,406,000
[illegible]	22,122,000	21,237,000	50,974,000

Although production of bituminous coal has increased since last year, the total appears less on account of the detachment of Polish Upper Silesia. A survey of this situation shows that hardly any change has taken place in the supply to the interior of Germany. The coal shipments from the German part of Upper Silesia average 100,000 tons per week, and from the Polish part 170,000 tons per week. The shortage which actually exists in the country is due to the grown consumption. Under present conditions the coal production of the country is inadequate, as evidenced by the increased imports, which are a heavy burden on the strained financial situation of the country. The state railways have from May to Dec. 1 required 3,374,000 tons, chiefly British coal; gas works, 487,000, and electricity works, 205,000 tons. The problem of the day is to obviate the disastrous imports or reduce them to a minimum by increased production.

During October, the output has increased to an average of 33,000 tons per day, netting a surplus of 22,000 tons over the August production. Nearly 80 per cent of the miners took part in overtime work during that month. The lowered efficiency of the miners is due to the constant rise in the cost of living, which is keeping the question of wages in a continued state of unrest.

Coal Paragraphs from Foreign Lands

GERMANY—Production of coal in the Ruhr region during the week ended Nov. 11 was 2,033,000 metric tons, according to a cable to *Coal Age*. The output for the previous week was 1,751,000 tons.

ITALY—The price of Cardiff steam first is now quoted at 39s. 9d. on the Genoa market, according to a cable to *Coal Age*. This compares with 40s. 3d. in the preceding week.

BELGIUM—Market firmness is everywhere becoming more marked. Orders are abundant, both for domestic and industrial coals. Sales are active and there is a good deal of delay in consignments. Demand for coke is strong owing to foreign purchases.

Market Has Strengthened With Tightening of Supply

Car Shortage and Slow Delivery Advance Spot Values—Release of Lake Tonnage Counterbalanced — Screened Bituminous Readily Taken as Substitute for Anthracite.

Tightening of the supply has strengthened the market. Cars are so short and deliveries so slow and uncertain that values for spot tonnages have advanced, especially on good grades. Individual cases of acute car shortage further complicate the situation, as producers refuse to cut prices on uncertain future loadings. The poor car supply has so far overbalanced the release of some Lake tonnage. Buying is increasing slowly, but inquiries are numerous, showing that the trend of demand will soon be stronger.

Screened bituminous coal is finding a more ready market as a substitute for anthracite. The cold weather is inducing many consumers to place orders for soft coal and prices for prepared sizes are strengthening daily.

NEW YORK

Irregular car supply, in the opinion of some local houses, caused a slight advance in quotations here. Further stiffening is looked for by the middle of the week. Conditions were better and inquiries were received in greater volume.

High-grade coals are quickly absorbed, operators in some instances being booked ahead to April 1 on the present basis of car supply.

Screened coal is being looked upon with favor here. Several local houses have been sending considerable nut and stove sizes to nearby towns, one firm, shipping the latter size, claiming they have been compelled to refuse orders. One cargo of Welsh anthracite was reported as arriving here during the week.

Southern coals are not coming forward in large volume. There were 1,468 cars at the local terminals on Nov. 24, mostly of Pool 10 and 11. Very little Pool 9 was to be had here, operators being heavily booked for it.

PHILADELPHIA

The car supply still holds back production and shippers are loath to make any promise whatever of prompt shipment. The car shortage this week has has made it somewhat difficult for producers to get forward full shipments of high-grade coals on contracts.

There is still a show of increasing demand for bituminous as a domestic fuel. Some local retailers have bought screened gas coal around $7 at mines. Dealers who handle the low-volatile, best grades of Pennsylvania steam coals, find that while it is difficult to make initial sales on account of the fine coal, they get better reports as it is tried out.

The railroads are still actively in the market for motive power fuel and with assigned car orders are able to keep ahead of current consumption and send some into stock.

At Tide there is no activity out of the ordinary. Two clearances for Havana were made last week. It would seem that normal movement is being resumed, especially with the old-time shippers.

Market prices have been held firm. Some had thought with the near approach of the Lake closing an extra amount of coal would be thrown on this market, with consequent lower prices, but it would seem that the car supply situation has overbalanced this.

BALTIMORE

Dealers say that the present conditions indicate a large increase in the demand and that in view of the scarcity of the better grades it will be necessary for the buyers to satisfy themselves with the lower qualities of coal. It is difficult to secure any of the better grades and it is impossible to guarantee prompt shipments of any character.

With the cold weather many of those who had claimed they were holding off for a reduction in price are now endeavoring to have their wants supplied at the prevailing prices.

To supply the wants of consumers is not an easy task owing to the car shortage on the Pennsylvania and B. & O., which is daily causing the situation to become more and more complicated.

The importation of English coal has discontinued and there appears to be but little likelihood of any renewal of this trade. Even in the face of the present conditions one cargo has been sent to Cuba and another to Porto Rico from Baltimore during the last ten days. There have been ten vessels, consisting of nine steamers and one schooner, to leave Baltimore since Nov. 6 in the New England trade.

FAIRMONT

Except where mines are loading railroad fuel and for the Lakes, much trouble is being experienced in securing enough cars to insure regular operation. Tidewater shipments seem somewhat heavier, notwithstanding weakness in the Eastern markets. In view of the higher price prevailing in Western markets, coal is being shipped to points west of the Ohio River whenever that is possible.

UPPER POTOMAC

Production continues on a large scale in the Upper Potomac and Georges Creek field. It is larger on the Thomas Division of the Western Maryland than on any other railroad division. In Georges Creek territory despite a continuance of the strike on the part of some of the older miners, there are approximately 500 men at work and that number is being daily augmented

CENTRAL PENNSYLVANIA

During the week ended Nov. 19, production amounted to 19,849 cars or a daily average of 3,308 cars, as compared with 17,287 cars in the week previous. The production from Nov. 1, to 19, inclusive, was 48,603 cars, while during the corresponding period in October 46,805 cars were loaded. There has been little or no change in prices.

Operators in Clearfield and Cambria, away from the main railroad lines, are complaining of car shortage. One operator with mines in both places declared that the car shortage has knocked the bottom out of business and it is impossible to hold the men. Under the present conditions, operators contend that they are working at a great loss.

West

KANSAS CITY

The so-called "buyers' strike" and recent warm weather caused the announcement last week of a cut of from 50c.@$1 on Kansas lump and nut. Operators, at the time they announced the reduction, predicted it would be only temporary, and that, with the arrival of cold weather and an increased demand, the price will advance. They are getting between 40 and 50 per cent running time nowadays.

Present quotations for Kansas coal are: Lump, $5; mine run, $3.50; nut, $4.50; screenings, $2.50. Arkansas semi-anthracite is selling at $6 for lump and $4 for nut. Missouri coal is quoted $4.50 for lump and $3.50 for nut.

DENVER

With mild winter weather in Denver coal prices are evenly balanced without much sliding up or down the scale. The car shortage still hampers many mines. However, between 3,000 and 4,000 men more than usual were employed in the Colorado mines during October and production totalled 900,000 tons which is the most the state ever produced in a month.

All of the producing counties except Routt and Fremont, show increases, and are led by Las Animas and Huerfano counties. The car shortage and strike during the summer are believed primarily responsible for the heavy decrease of production in Routt and Fremont counties, except for a period of thirty days when the Moffat road was blockaded at a tunnel.

SALT LAKE CITY

The car situation is still very bad but some relief is expected at an early date. The weather has moderated and retailers are still able to supply all demands. With the car shortage this would not be possible, even with warmer weather, more coal being bought for storage. Many consumers are ordering two and half tons at a time. Lump and screened slack are the sizes in greatest demand.

Anthracite

Crisis Impending as Cold Weather Appears

Low Retail Supplies Force Householders to Take Substitutes—Screened Intermediate Moves Better to East—Briquets and Coke Bring Fancy Prices—Companies Promise Early Relief—Steam Circular Reduced

Cold weather is precipitating a crisis in the anthracite trade. Retail supplies are nearly depleted and householders are forced to take to substitutes. In the East screened bituminous coal is moving better and briquets and coke sell at fancy figures.

Companies promise immediate relief, however, now that they have made an impression on the Northern demand. Independent operators have increased their prices and even pea coal is selling at close to $10. Steam sizes are in better position, but one large company has cut its circular 50c. to move quickly before the price cut overstipply.

PHILADELPHIA

The consumers' need for fuel has become more acute with the coming of the cold weather. Unless prompt relief is given in the way of shipments a crisis is bound to result. The companies have finally promised the dealers to make shipments from Dec. 1 on, as the government has relieved them of some of their obligations to the North. The retailers continue to take orders, but only subject to their ability to make delivery.

The rumors of increased independent prices have now turned into reality. Under the circumstances, $10 for coal at retail will be quite common from now on.

Dealers handling briquets report an active demand, with the price around $14. There is also an increasing use of byproduct coke, which is selling at the ovens in a mixed pea and nut size for $[illegible]. Retail prices on this run $[illegible].

The colder weather has started some improvement in steam sizes, but not sufficient to take up the slack. Buckwheat is still readily obtainable at $[illegible], with rice and barley available at last week's quotation, although barley shows some signs of being lost from.

BALTIMORE

Sharp weather has caused a heavy crisis in consumers' bins and the usual rush orders, which were furnished by the householders earlier in the season are now nearly depleted. Dealers are not getting sufficient amounts to enable them to meet the urgent demands that are being made upon them. A substitute will have to be used as the cold weather increases in its intensity and many of those who have held off from soft coal will be forced to use it. The retail price has not changed since September.

There was a large decrease in the amount of hard coal received here in November as compared with October. During the entire month of October 1,372 cars arrived, while up to Nov. 24 there had been but 700 cars brought in. Like the bituminous coal, the trade is severely handicapped on account of the car shortage.

BUFFALO

The supply is so disappointing that the advice now is that, as so much substitute fuel must be provided, the thing to do is to make up the deficiency by laying in briquets, coke, soft coal and steam sizes of anthracite or wood. Sealed box cars are shipped this way to keep people from seizing the coal on the way. At the same time many towns are without any sort of fuel, according to report.

Meanwhile the Lake trade is about to close for the season. Shipping agents appear to think that no effort will be made to keep it up till the Lakes are closed by ice, though grain will continue to come down as long as it is possible to move it. Loadings at the Lake last week were 110,100 net tons, of which 48,800 cleared for Duluth and Superior, 8,000 for Ft. William, 2,800 for Marquette on Lake Superior, 24,300 for Milwaukee, 10,000 for Chicago, 7,700 for Manitowoc, 6,800 for Sheboygan, and 1,700 for Menominee on Lake Michigan.

NEW YORK

Steam sizes are in better shape but are not moving as rapidly as desired. One of the large producers, it is said, is cutting the regular circular on buckwheat, rice and barley 50c. per ton. It is hoped in this way that movement will be stronger and that the congestion now existing in these coals will be somewhat lightened.

Closing of Lake navigation to domestic coals is being anxiously awaited by the local trade. Retail dealers' stocks are at a minimum. Consumption was much heavier last week because of colder weather.

Many dealers continue to enforce the rule of the State Fuel Administration that consumers when ordering domestic coals include in their order a proportionate share of the steam sizes. Unprofitable buckwheat has been taken care of in this way.

While most of the large independents are asking about $10.50 as the maximum for the domestic sizes, it was said that some of the smaller operators were gunning as high as $12 in line buyers. It is not believed that any of the high-priced coal is coming here.

The surplus of steam sizes at the railroad terminals on the Jersey side of the river is being rapidly reduced. An announcement was made by the State Fuel Administration that during the week ended Nov. 22 the usual supplies of 50,000 tons had been cut 16,000 tons because of the increased demand.

BOSTON

The heavy volume of prepared sizes going forward to the Lakes has kept this market for the most part almost starved for continuing supply. Dealers are looking forward anxiously to see whether an increased tonnage for New England will actually materialize.

In the retail trade there is no change worth reporting. The fuel functionaries are plastering the public with advice to get substitutes while the public goes serenely about its business of using anthracite sizes and acquiring an advance supply as opportunity offers. The impression that people sit idly by while their plumbing freezes is a myth.

South

VIRGINIA

Production was increased during the first half of November owing to better transportation conditions. Production is larger on the Interstate than on any of the other roads penetrating this region. There is also a somewhat more diversified market, with the demand stiffer at Tidewater. Prices too are on a somewhat higher level.

BIRMINGHAM

Carriers are making little progress in providing the needed equipment for moving the production of the mines. Release of open-top cars from the priority use of the coal mines is expected to further curtail the number of cars available, as there is apparently no avenue at present from which this loss can be recouped.

Steam inquiry is lacking in strength and volume. Consuming industries are only buying what is needed for the immediate future, presumably expecting prices to take a further slump. Demand from domestic sources is good. Dealers nowhere have stocks of any consequence, and those having contracts are not receiving their monthly quotas. Some yards in the Birmingham district are entirely clean.

Quotations have not changed during the past week, both steam and domestic prices being practicably stable. Productions during the week ended Nov. 11 was 345,000 net tons, or about the same as the previous week.

TORONTO

Receipts of anthracite continue very light and dealers are frequently refusing to accept orders—some of them eking out small supplies by mixing nut and pea coal. Many consumers are using coke which is retailed $16.90, and a number are burning soft coal. Dealers are anxiously anticipating the close of navigation when it is hoped that the situation will be relieved.

Bituminous is plentiful but prices for carload lots, f.o.b. destination, continue variable, ranging $8.75@$9.75. Pennsylvania smokeless is $9; steam lump retails at $13.25 and domestic bituminous at $13.50.

Chicago and Midwest

Screenings Demand Steady But Prices Do Not Soar

Reduced Output and Some Stock-Pile Buying Stimulate Steam Market—Snappy Weather Has Small Effect on Domestic Trade.

In spite of the cold wave which swept down out of the North about the middle of last week, the domestic market did not liven up much in this region. Instead, steam buyers furnished all the interest there was. This put just enough life into the screenings market everywhere except St. Louis to absorb about all the screenings available.

Many mines have closed down because of flat domestic market, thus reducing the volume of steam sizes offered. Kentucky is full of unsold coal, especially in the western field where car supply is growing better. Eastern Kentucky coal is spreading into many markets now that Lake shipment is stopping.

CHICAGO

Screenings remained the headliner in this market at the end of last week. There is no crying demand for this small steam coal, but interest in it continues to freshen little by little for two main reasons. First the slackening of call for domestic sizes over a period of two weeks or so has shut down a number of mines that had been dumping screenings on all Midwest markets, thus curtailing the volume of steam coal available and second, some of the heavy steam consumers continue gingerly to buy a bit more than their day-by-day demands require.

Southern Illinois is getting the bulk of the business. Mines that produce high class coal and are equipped to prepare it excellently are still getting $3 on certain country contracts but no spot screenings have sold that high in weeks. Good 2-in. usually brings $2.25@$2.40 and 1¼-in. sells generally for $2.25 though there is some shading to $2.15. Poor grades from the southern field range from $2 up. Other fields' screenings run down to $1.50 for Standard district coal. Indiana steam is moving into this market in increasing volume. The freight rate advantage makes it a strong competitor.

Domestic demand continues weak. Most local yards and some in the country are fairly well stocked and it will take a week of the present snappy weather to stir up a good lively demand. The big operators are clinging closely to $5.50 for Southern Illinois lump and egg and are finding just enough market to absorb the output. The lesser operators in the same field have shaded as much as $1 at times in order to move coal on certain troublesome days. Lump from other Illinois fields ranges down to $3. These are days when operators who have spent thousands of dollars in past years advertising the name and quality of their output are cashing in on that investment.

A slight advance in anthracite has been noticed here. This amounts to only 20c. or 30c. on the circulars of those companies whose prices have been lowest. Other company quotations remain unchanged. Very little hard coal is reaching here except through two shippers. Independent prices are too high to win any Chicago business. Railroad congestion and other obstacles continue to choke off the volume of smokeless fuel.

ST. LOUIS

Mild weather up to the middle of last week practically stopped domestic buying, not only in the city but in the surrounding territory. The colder days that followed had only a slight market effect, for all dealers have yards full of coal to be unloaded. Most of it is high priced. Although the mine prices have decreased dealers cannot comfortably reduce retail prices. The public is buying only from day to day, still expecting a drop in price. The local steam trade is easy. Very few plants are storing. They also buy from day to day.

There is a falling off in the country tonnage. Small plants are going to oil and electricity. Even in St. Louis there has been a large business done in kerosene and oil burning devices for residences. Complaint is made by the city that the smoke nuisance this year has exceeded that of any previous years.

A large tonnage—perhaps 400 tons a day—is also coming in by trucks from the mines between East St. Louis and Belleville. There have been no smokeless receipts and only 1,000 tons or so of anthracite during the week. Hard coal has advanced 50c. and coke gets more plentiful now that gas coal is reaching here in some volume.

SOUTHERN ILLINOIS

The car shortage—a plague a month ago—is a blessing now. It has helped to maintain prices in the Carterville field, in the face of mild weather and no demand. The car supply has shown considerable improvement but there is still a shortage. Mines are averaging 2 and 3 days a week. The market is gone on steam sizes temporarily. Domestic prices are maintained at $5.50 by the association operators, but the independents are down to as low as $4.50. Screenings range $2@$2.50, but there is no demand for anything and railroad business that two months ago was secured at is readily sought.

In the Duquoin and Jackson County field prices are softening. The car supply on the Illinois Central has improved. The Mt. Olive district has a surplus of everything and some mines in this field are idle on account of no bills. The tonnage to Chicago and the Northwest is fair on domestic sizes but slow on steam, and St. Louis has almost quit. Prices seem to be maintained, however. Standard district operators are trying to run their mines regardless of loss. There is very little demand for Standard and railroad tonnage is light, excepting on the Mobile & Ohio which is storing.

WESTERN KENTUCKY

The market here, faced with a much better car supply than it has had in months, and with a slow demand for all sizes, is having trouble in selling coal, and prices have been working steadily lower. It is reported that some high cost mines are closing down.

It was reported on Nov. 20, that there were approximately 120 cars of unsold fuel on tracks at western Kentucky mines. Demand for lump has been a shade better the past few days because of freezing weather and this has created a little demand from small steam consumers.

Demand for screenings from industries continues fairly good, and production of lump is creating a fair volume of screenings. Lump is quoted at $3.50@$4; mine run, $2@$2.50; screenings $1.25@$1.75. Most of the lump is reported as selling at around $3.75, and mine run, $2.25.

There has been a big improvement in car supply. The average for the month up to Nov. 20, showed the L. C. at 30.3 per cent; L. & N., O. & N. division, 22.5 per cent and Henderson division, 34.7. This is enough, for mines are not requesting many cars.

LOUISVILLE

Slackening of Lake movement was followed by weakening markets due to large tonnage from eastern Kentucky, West Virginia and elsewhere being offered in the open market. Prices of eastern Kentucky coal are lower, and are expected to go down considerably, as operators will be forced to move coal in order to get prepared business.

Retailers here for months have been disgusted with the action of eastern Kentucky operators in holding lump at $2 or more above mine run, thus preventing retailers from stocking and handling eastern Kentucky coal. Western Kentucky lump has dropped to $3.50@$4 at the mine, and is selling here at $2 or more under eastern Kentucky lump. Cold weather last week put a trace of vigor into the coal market.

Some of the coal men are looking for sharp breaks in eastern Kentucky prices. Right now eastern Kentucky lump is around $6@$6.50 block, $6.50@$7; mine run, $3.50@$4, and screenings, $3.50@$4.25.

INDIANAPOLIS

Colder weather has stimulated the domestic trade a little. However, dealers declare the demand is nothing to what it should be and they are becoming worried over a possible congestion in case of severe weather. Screenings continue to hover around $1 with a slight increase in demand and an occasional sale at as much as $1.25. Prepared coal is bringing $3@$3.50 at the mines and there is a little stronger tendency.

A gradual expansion in industry is reported from nearly every corner of the state. This should increase coal demand. Much optimism is expressed by the coke over coal prices.

Eastern Inland

Markets Are Without Life Pending Close of Lakes

Prices, Except for Domestic, Soften—Buying Movement Expected After Close, Consumers Awaiting Effect of Diverted Tonnage—Trade Sees Ally in Winter Weather.

Lifeless markets are preceding the closing of the Lakes. All prices except that of domestic coal are softening and if demand does not pick up soon no-market losses will again appear in the near future. Dec. 5 should see the final Lake shipments from the mines, however, and a substantial buying movement is indicated after that, as the consumer's tardiness is attributed to the belief that the diverted tonnage will soften the market.

Domestic movement is increasing rapidly, especially in Ohio, where higher prices have been authorized. Retailers are not stocking heavily but frequent replenishments are being ordered as the consumer is forced into the market by the colder weather.

CLEVELAND

With the slowing down and near approach of the complete ending of the Lake movement, the market for industrial fuel continues heatless. Coal is getting in better supply and within the next week or so it will be even more ample. By that time it is expected that a substantial buying movement from industrial consumers will get under way. Cold weather is rapidly approaching and many plants soon will find it advisable to increase their stock piles, against January freight troops.

Prices have been giving ground a shade further. The future course of quotations will be determined by the extent of buying as it develops within the next few weeks. If demand continues dormant, with the increase in available supplies, further declines seem sure. The trade, however, generally expects improvement.

The retail trade is experiencing a better demand. Dealers are now getting more orders and supplies of Pocahontas are expected to become much more liberal as the Lake shipments cease. Pocahontas domestic coal is quoted at $3.50 against $3.75 respectively. Anthracite orders are taking a spurt at delivery, the range being $14@$15.40.

PITTSBURGH

The market has become quiet and prices are off flat, in many cases for domestic lump. It is difficult to distinguish between cargo and offer to consumer, with the latter declining. Mine shipments for the Lake trade are ended, sooner than operators expected. Railroad purchases are greatly reduced, and this may be due to expectation of lower prices or may be assigned as the cause of lower prices now quoted. There is even talk in some quarters of the possibility of production being curtailed soon by scarcity of orders.

It is an hour-to-hour rather than a day-to-day proposition as to cars in the case of most mines. The extreme scarcity explains the curious phenomenon observed for many weeks, of screened gas and gas slack selling at prices making a combination well above the mine run gas price.

The steam coal market is so cut up as not to be very closely quotable, $2.50@$2.75 being probably a fair range at this writing. Youghiogheny gas is down to about $3.25 for mine run, with slack nearly as high and screened, $3.75@$4. Byproduct is not quotable, there having been no transactions of importance in the past few days. Domestic 1¼-in. lump remains quotable at $4.50 but is hardly strong at that figure.

DETROIT

There is still a lack of interest among buyers. There is some business being done every day but the aggregate falls much below the mark which jobbers and wholesalers believe should be attained. The buying is proceeding irregularly and apparently represents the efforts of steam plants to provide only for present needs.

West Virginia and Kentucky 4-in. lump and egg is quoted at $6; mine run is $5.75, and slack $3.50. Hocking lump is $5.50; egg, $5; mine run, $3.50; nut, pea and slack, $2.75. Pittsburgh No. 8 lump is $4.50; mine run, $3.50; slack, $3. Smokeless lump and egg is $8 and mine run $6. Very little smokeless is available.

Domestic consumers who rely on prepared sizes of anthracite are apparently destined for disagreeable times. The daily receipts are smaller than a month ago, averaging about 33 per cent of normal.

BUFFALO

The market sags slowly, but steadily. While prices have not gone off much, it is found that even Pittsburgh, which is always much stronger than Buffalo, has weakened and will no longer insist on former quotations. As a rule Buffalo has steadily refused to pay them and it has used the Allegheny Valley and No. 8 supply to enable it to dictate what it will pay for other coal.

Consumers report that they are offered more coal than they need, so they buy at bottom prices and are satisfied. A few shippers have the confidence of the heavy consumers so fully that they are able to get extra prices for the best coal. To be able to do that a shipper must have a complete knowledge of the quality of all coal handled and be sure to deliver the quality that he offers. It is not an easy thing to do.

Quotations are $5@$5.25 for Youghiogheny gas lump, $4.25@$4.50 for Pittsburgh and No. 8 steam lump, $3.25@$3.50 for all mine run and $3@$3.25 for slack, adding $3.09 to Allegheny Valley and $3.24 to other coals to cover freight.

COLUMBUS

Lake trade is now practically over. This has released a good deal of coal for commercial purposes. As a result weakness in steam sizes is developing, although the domestic trade is still holding up quite well. The weakness is not sufficient to cause any radical change outside of lower prices on mine run and screenings.

Retailers are buying rather actively and a considerable quantity of prepared sizes is finding its way into retail yards. Consumers are still playing a waiting game, believing that prices will be lower and are thus placing small orders as a rule. Retail prices are generally firm at former levels. Only a small quantity of smokeless is coming into this market.

Steam business is more quiet as many of the larger users have succeeded in building up rather good reserves and are only buying for immediate needs.

EASTERN OHIO

By reason of improvement in the car supply, mines produced more coal during the week ended Nov. 18 than during any week since the resumption of mining in August. Output was 348,000 tons or approximately 56 per cent of capacity, and exceeded the previous week by 75,000 tons. The lowest supply was on the Wheeling & Lake Erie, where only 45 per cent of requirements were furnished.

Activity in the domestic trade is reflected through the retailers' efforts to procure lump coal. It is understood that Pocahontas and other West Virginia and eastern Kentucky domestic fuels are now available in larger quantities than heretofore, but retail yards still find it necessary to ration their trade. Since the allowance by state authorities of 50c. per ton additional on lump produced in Ohio, a greater quantity of Ohio lump is now available.

In the steam trade, operators and jobbers report sluggishness and a disposition still exists to defer storage programs because of expectation that not only a better selection can be made but that lower prices will necessarily result from the cessation of Lake shipping. In fact, with Lake shipping already tapering off, slack and nut and slack and mine run can now be purchased in the open market at figures lower than the maximum set by state authorities.

Receipts of bituminous coal at Cleveland show a slight recession from the record figure established during the preceding week. Total arrivals were 2,119 cars during the week ended Nov. 18; divided: 1,551 cars for industries and 568 cars for retail yards.

NORTHERN PANHANDLE

Car shortage and the difficulty of getting coal moved to market alone stands in the way of capacity production. The trouble is in getting coal through the Holloway yards of the B. & O., one of the principal outlets for the field. Railroad fuel buying is on a large scale.

Northwest

May Embargo Soft Coal To Ship More Anthracite

Failure to Get Hard Coal Allotment Is Driving Shippers to Extremes—Prices Advancing — Competition with Rail Men Is Keen.

The crying demand for the full allotment of anthracite—an allotment which was expected to equal 60 per cent of the normal deliveries—is starting a movement which may soon result in an embargo or partial embargo on the part of Lake shippers against soft coal so that more vessels will be available for anthracite transportation. In order to get the allotment, it will be necessary for boats to bring up 160,000 tons a week until Dec. 15, which is almost impossible.

The call for most bituminous coals is comparatively light. Plenty of Illinois and Indiana fuel is arriving by rail in the southern part of this region and the docks have amassed considerable piles of Eastern coals. Docks are making their usual price concessions in competitive sections, in order to get business, and some rail shippers are meeting their quotations but most Illinois domestic sizes are offered steadily at $5.50.

MINNEAPOLIS

The failure of adequate supplies of hard coal to come along has created considerable alarm. Slightly over a third of the allotment had been received up to the middle of November. The period of navigation has been extended for two weeks.

Any shortage will have to be made up by all-rail shipments. To mitigate the situation, it is proposed to ship from present stores of hard coal to the more extreme points, giving them the advantage of the lake and rail freight rate, as the all-rail rate to such places would be prohibitive.

That the proposition to stop soft coal to the docks is seriously considered, shows how well the various soft-coal mines have made up the undoubted deficit which existed at the time of resuming operations. It has not been accomplished wholly by the Eastern mines. On the basis of the usual dock supplies, there is a considerable shortage. But while the soft-coal tonnage has been moving to the docks, the all-rail shippers of Illinois, Indiana, and elsewhere also have been moving soft coal into this district. They have crowded the dock business until a decidedly short tonnage on the docks looks sufficient to meet current demands for the winter, plus what may and doubtless will be received from the all-rail shippers.

Prices have been demoralized, dock coal selling at close to last year's price and all-rail coal having a wide range of values. Some of the rail shippers insist that they are adhering to the $5.50 price at the mine, but many do not. The mild and open weather, prevailing until well toward December, has undermined the expectations of wholesalers who had counted upon a much stronger market.

MILWAUKEE

The week brought little change in the coal market. Mild weather and fair arrivals by Lake combine to allay anxiety as to the winter supply, and hold the demand in check. Enough anthracite has been received to enable dealers to give almost everybody a small amount, but there will be a rude awakening to the anthracite shortage when the first real cold snap develops.

Anthracite is in for a general advance in price. The ruling retail rate for some time has been $16.50 for egg, carried in, $16.75 for stove, $16.70 for nut, and $14.75 for pea. A leading retail company is now holding egg and nut anthracite at $17.25, and pea at $15.25. The chances are that these prices will soon be charged all along the line.

Thirteen cargoes of anthracite were received in November, the aggregate being 110,639 tons. During the same period 31 cargoes of soft coal, aggregating 258,501 tons were docked. Anthracite receipts since navigation opened, now total 252,753 tons, and soft coal, 2,204,401 tons. Last year 938,329 tons of anthracite and 2,533,833 tons of soft coal had been received up to this time. These figures do not include car-ferry or rail receipts.

DULUTH

Definite announcement has been made by the state fuel administrator that the coal now on dock at the Head-of-the-Lakes will be used for upper Minnesota and Superior exclusively because there will be insufficient anthracite for the Northwest, and the bituminous supply must be conserved. Lower state points and North Dakota will receive coal by all rail, although it is supposed that some of the bituminous on docks will be ordered to North Dakota later.

Anthracite shipments are falling off. Last week, of a total of 44 cargoes received, but four were anthracite. There are 27 cargoes en route and of these but two are hard coal. The available supply is negligible and with householders fighting for it as now, it will be exhausted immediately at the close of navigation.

A recent unofficial survey shows 2,300,000 tons of bituminous on the docks as against about 5,500,000 tons at this time last year. This does not include approximately 1,000,000 tons of bituminous at the steel corporation.

Prices remain firm here. Some report comes from lower state points of weakening prices. This will not affect the market here as cold weather has set in and the ground is white. It is said that the lower prices below are caused by lack of present demand because of milder weather.

New England

More Coal Now Available And Inquiry Is Stronger

Improvement at Roads Also Shown in Car Supply—Resumption of Textile Mills a Helpful Factor—Price Advance May Turn Eyes Toward Pennsylvania All-Rail Coal.

There is a perceptible improvement in conditions at Hampton Roads. Not only is car supply somewhat better but prices are 25c higher, and while there is more coal available, inquiry is sufficiently stronger to warrant the steadiness that now seems to prevail. A few agencies were caught with not quite enough supply to meet obligations, and this kind of demand was enough to turn the corner.

There is also observed a slight increase in demand at rehandling points here for shipment inland and spot prices have advanced from $8.50 to $9.25 per gross ton or cars. As yet there is nothing like broad inquiry, but conditions are somewhat better, due partly to resumed work in the various textile mills.

Practically all the Pennsylvania operators who figure at all in this market are satisfied to get contracting orders on present price levels. The few who felt they are opening for small advances have now receded and are making new business at the same prices that prevailed a month ago. It is noticeable, however, that since Southern shippers have asked more for their output that there is renewed interest on the part of a few buyers in the more desirable Cambria grades.

The railroads have central Pennsylvania operators guessing with respect to car-supply. One day practically a full quota of cars is delivered and then for two or three days none at all. In consequence the shippers are in doubt whether to sell ahead at present prices, or whether to take the market as they find it.

While receipts by water have shaded off the past fortnight, railroad figures show that coal is coming through the Hudson gateways in somewhat larger volume. This is due partly to efforts of the railroads themselves to accumulate more reasonable reserves, but is also due to greater increased buying on the part of industrial.

Cincinnati Gateway

Interest Veers Southward From Northern Stodginess

Orders Go to Virginia and Southeastern Kentucky Mines — Empties Return More Freely — Car Accumulation at Lakes Keeps Northern Ohio and Michigan Out of Market

It is a notable fact that coal flows freely through the gateway in almost any direction. Attention can be drawn to the fact that this week offers to the Queen City are turning to the South and mines in Virginia and southeastern Kentucky that are able to direct their offerings to the Southern markets are being supplied with orders. Since the softness developed here business from that quarter is more desirable and attractive than the stodginess of the North.

Movement of empties to the mines has been freer this week. It also is a prime point of consideration that northern Ohio and Michigan has not been a competitive customer for the past week or two, due to the accumulation of cars at the Lakes. This and the open weather have largely been the causes of values here seeking a lower level.

LOW-VOLATILE FIELDS

New River and Tug Gulf

New River mines are finding it just as hard as ever to get anything like an adequate car supply, in consequence of which the average mine is not working more than one full day a week. There is not enough coal produced to take care of the general run of contracts so that little is being marketed on a spot basis. The limited production makes it out of the question to ship much coal to Western markets where there is a better demand.

Production is on a little larger scale in the Winding Gulf region, owing to a somewhat better car supply, but mines are not receiving more than 50 per cent of allotment.

Pocahontas and Tug River

Pocahontas producers are just finding it possible to speed up production to extent of 45 per cent of potential capacity. The N. & W. is not letting much of the larger equipment move to points west of the Ohio River though the open market demand in the West is much bolder than in the East. As a matter of fact, there is little Pocahontas coal being sold for immediate loading to Western centers, most of the coal being under contract.

Little more than half the potential capacity of the Tug River field is being produced, the shortage of equipment being due to the comparatively small number of mines running here. Operations are still forced to plug along with about one full day's work per week inasmuch as the car supply does not amount to more than 25 per cent of allotment. Mines do not find it possible even to keep up with contract orders much less dispose of any coal on a spot basis. In fact, market conditions would warrant a much larger movement to the West. As production costs are so high mine owners claim that it is impossible for them to produce lump at the maximum price of $4.50.

Logan and Thacker

Logan mines are getting a much better supply than heretofore owing to the fact that the C. & O. is trying to make up for a deficiency in the supply of equipment existing since the strike. The larger production after all just about permits mines to catch up with the tonnage for regular customers, there being little or no surplus for spot sale and shipment. There is a better demand for gas coal than for steam grades.

It has not been possible so far to increase production to a point beyond 40 per cent of potential capacity in Williamson and other sections of the Kenova-Thacker district. The product of the field is moving largely to Western markets, most of it on contract.

Northeastern Kentucky

Mines are getting a little better car supply. Production is now at the rate of about 40 per cent of capacity. Larger shipments to the Lakes tended to swell the output, as it was possible to secure the return of cars promptly. Gas coal is in better demand than steam.

CINCINNATI

With all grades of splint and gas dropping down—except the domestic sizes—attention has again been directed to the extraordinary position maintained by the low-volatile coals. Slack has shown a little tendency to weaken with some sales below the $6 mark for the first time in weeks. It is known, too, that more lump coal is getting into the hands of the brokers and their quotations are again appearing. Just as singular is the fact that several of the selling agents continue to take orders at the Hoover prices and that a couple of weeks more will see them caught up on the present bookings unless the weather interferes.

The drop in interest of the takers of byproduct coal has resulted in lowering the price so that the spread is less today than it has been in months. Heavy production of low-grade coals in the steam line and a disposition to cut the price has been reflected by the better grades following suit. Just how far this will go will be largely governed by the weather, which if it continues open for another couple of weeks, may see another quick sliding market. Domestic sizes hold up well even though some of the mines are now specializing in sizes—that is specifying egg, 2-in., lump, and block in their shipments.

Coke

UNIONTOWN

While the coke market, stimulated by the demand from several additional furnaces, is strong, the coal market has been softened by the disappearance of orders from the Northwest for the Lakes trade. The changing status has not been so pronounced as to change prices but a shift upward in coke quotations is expected. A steadily increasing demand since operations were resumed upon a normal basis gives support to the contention that an upward drift is approaching.

Eastern consumers discontinued buying several weeks ago apparently with the expectation of lower prices when the Lakes were closed to transportation. Prices continue at $3 for steam coal and $3.50 for byproduct. Those quotations for several weeks have withstood a steadily decreasing demand and the fact that operators are refusing to close sales below those figures leads to the opinion that the bottom also has been reached in coal prices. A number of cases are known where mines suspended rather than sell tonnage below $3.

CONNELLSVILLE

Prompt furnace coke is up 50c., reflecting the absorption of considerable tonnage by five blast furnaces resuming with Connellsville merchant coke. The market is now quotable $7.25@$7.50. This is for odd lots picked up in the open market. Operators having arrangements to supply furnaces regularly, at a price to be adjusted at intervals, did not recognize the low spot market. Contracts to the end of the year, involving a regular supply of good coke, could hardly be placed at below $8, if even at that figure.

With pig iron sagging furnacemen regard coke as entirely too high but they exert very little actual pressure on the market because in most cases they are covered to the end of the year at higher prices, $8 and upward. There is some tentative inquiry out for first quarter or first half, but it is altogether improbable that producers and consumers will be able to get together. Foundry coke is a shade easier, at $7.50@$8. Demand continues rather light.

The *Courier* reports production during the week ended Nov. 18 at 119,850 tons by the furnace ovens and 62,530 tons by the merchant ovens, a total of 182,380 tons, an increase of 5,500 tons.

BUFFALO

Coke has become very scarce, as consumption by the local furnaces now exceeds the amount turned out by the byproduct ovens. Buying in the open market has been resorted to. Jobbers quote Connellsville foundry at $8, furnace at $7 and stock at $6, with a small supply of chestnut at $10 for domestic use. No byproduct coke of local make is to be had here for house consumption.

News Items From Field and Trade

ALABAMA

John W. Porter, vice-president of the Alabama Company, in charge of sales, has been placed in charge of operations, succeeding **Harry W. Collin,** resigned.

The County Coal Co. will electrify its mines and install Marcus screens for grading its output, according to announcement of C. C. Copperstone, general manager, Birmingham.

COLORADO

James Dalrymple, state inspector of coal mines, is authority for a report that the employment of coal miners in Colorado reached a record mark in October, there being 15,055 engaged in the industry. This registers an increase of 3,000 to 4,000 over the usual number, and is the first time since the establishment of the inspector's office that more than 15,000 have been employed. Records of coal production give October 900,000 tons, an increase of approximately 100,000 tons over September, and the first ten months of 1922 a lead of 189,312 tons over last year.

CONNECTICUT

The City Ice & Coal Co., Bridgeport, large coal retailers, has increased its capital stock from $300,000 to $500,000.

ILLINOIS

The office of the **Henderson Coal Co.** near O'Fallon was burned recently. The origin of the fire is suspected to be incendiary as a few weeks ago the barn at the same mine was burned.

The Condit Coal Co., of Centralia, recently moved into new offices in that city. The company recently completed the erection of a new concrete office building in which the company's business will be located.

The stripping operation at Opdyke, near Mt. Vernon, under the direction of **J. A. Koons, has been stopped** until next spring. The coal when the mine was first started was only 5 ft. from the surface, but as the stripping progressed it rapidly inclined so as to soon be too deep for the shovel employed. The owners now plan to purchase a new and larger shovel next spring together with other equipment and re-open the plant.

The Midway Coal Co., of Ward, has filed papers in Murphysboro conveying its mine property to the **Chicago Fuel Co., Inc.,** Chicago. The mine is located on the main line of the Illinois Central near De Soto and was the scene of a recent disastrous fire. However, the mine is said to have been completely repaired and put in first-class shape since the fire.

The Lemon McKelvey Coal Co. has capitalized with $25,000 at Sparta, to operate an inland mine a few miles back from Sparta.

The washer at mine No. 8 at Clifford of the **Consolidated Coal Co.** of St. Louis was completely destroyed by fire on Nov. 16.

The Shuler Coal Co. has begun mining coal at Alpha, with three eight-hour shifts at work. A high tension electric line is in and the shaft is down to the seam. Work will be rushed on the new mine day and night until it is completed. A temporary hoist has been constructed. The Shuler company has rights to 10,000 acres of coal lands.

The Sunnyside Mining Company, Herrin, has announced that it will soon launch a $450,000 bond issue and has filed with the circuit clerk at Marion, a trust deed for that amount with the Chicago Trust Co. The company will use the sum for further development of its mining properties and will install a large amount of new machinery and equipment.

The Buckley Coal Co., Springfield, has just been incorporated and capitalized at $100,000. The headquarters of the new firm will be at 626 Reisch Bldg. and is composed of the following incorporators: Carl H. Elshoff, E. H. Buckley and Gerald W. Schwaner. The company will mine and deal in coal and coal lands.

The Sharon Coal Mining Co., Chesterfield, has been incorporated with capital of $200,000 by Seymour A. Rhode, Lewis Clements, Robert Pettigrew and [illegible] Donaldson. The company will engage in general mining.

Incorporation papers have been issued to the **Prairie State Coal Co.,** with offices in Chicago. Those interested in the new company are James J. Hickey president, coal broker, Springfield; W. J. Smith vice-president, Chicago, formerly of the Holland Coal Co., and W. M. Ryan secretary, Springfield. Mr. Hickey will continue his coal brokerage business in Springfield.

The Calorie Strip Mine, formerly the Southern Illinois Coal Co., will open for operation sometime in December. A report that the Peabody Coal Co. was to operate this mine was erroneous. This is one of the largest strip mines in southern Illinois. Robert Sherwood is president of the Calorie Coal Co.

INDIANA

The Latta Coal Mining Co., with a capital stock of $50,000 has filed articles of incorporation in Terre Haute. Charles A. Crawford; John F. O'Brien and Bert Beasley are the incorporators of the new company, which is organized for the purpose of mining and selling coal.

Provision for the purchase of 325 coal cars and other equipment for the Cincinnati, Indianapolis & Western R.R. has been made in the organization of a subsidiary company, known as the Cincinnati, Indianapolis & Western Car Equipment Co. Orders for the equipment have not been placed, according to one of the directors of the company. The new company has a capitalization of $150,000 of which $50,000 is preferred stock. E. J. Goebel, secretary of the C. I. & W., is president of the subsidiary corporation.

Officials of **Rose Polytechnic Institute,** at Terre Haute, say that within the next year or two **mining engineering will be included in the course of study.** The department will be placed on an equal footing with the other five departments. The Department of Mines will co-operate with the new department, it was said. R. L. McCormick, professor of applied mechanics, will be asked to take charge of the new course. He has been active in mining engineering for the last 30 years and is conversant with the problems of the industry.

The Chicago Heights Coal Co., an Illinois corporation, has qualified to do business in Indiana. A total of $[illegible] of the corporation's capital stock is represented in Indiana.

A "windy" shot at the Mohawk mine near Linton recently destroyed the framework of the tipple. Prior to the firing of the shot the hoisting engine broke with a loaded car in the tipple. The engine room and the cages were badly damaged. The mine will be idle for six weeks for repairs.

The supply of coal cars to mines along the Southern in Indiana **is improving,** according to **Harry W. Little,** manager of the Southern Indiana Coal Bureau, who has completed the compilation of figures representing the operations of the 18 mines along that railroad last week. The Big Four and the E. S. & N. traction line furnished a total of 196 cars over the Southern, making an average of [illegible] per cent of the cars ordered. The mines were able to work [illegible] of the 765 potential running hours, an average of 25.1 per cent of the running time.

A [illegible] handling the Carlisle coal sold with the Big Four will be built near [illegible] and it is expected the **Pike County Coal Co.** will begin work on [illegible] near Oakville. The mine will have an [illegible] tipple. It is [illegible] Pike County.

The Primrose Coal Producing Co., of Evansville, has increased its capital from [illegible] to $[illegible].

IOWA

Financial activity is [illegible] in this section of Iowa is **prospecting for coal.** A [illegible] was mentioned in the vicinity of Lost Grove, Boone County. Another county in the same coal seam is [illegible] the operations have proved unsatisfactory. What promises to be the largest field in [illegible] is being developed at Harcourt, a few miles east of the city of Fort Dodge. Farmers have found coal under [illegible] of the land formerly occupied by Camp Dodge during the days of the war. In Page County the discovery of [illegible] varying thicknesses [illegible]. In the vicinity of Western Union County rich mines have been opened in recent years.

KENTUCKY

John Hoffman, [illegible] and L. F. Kerling, of the Kentucky Coal Co. [illegible] their interest in [illegible] and [illegible] of their affiliated companies, the Log Mountain Coal Co. [illegible].

C. A. Johnson of the Bankers Fuel Co., Louisville and [illegible] has a contract in the New York market [illegible].

Texas and Kentucky people have organized the **Baum Coal Co.,** with a West Virginia charter, for the purpose of operating in the Kentucky field. The company, having a capital stock of $[illegible], has its office in the [illegible] at Lexington. Largely identified with the new company are H. H. Cole, J. J. Stevens and T. E. Arnold of Fort Worth, Tex., C. P. Hall and W. G. Dunn, of Lexington.

MARYLAND

It has been possible for the **George Creek Coal Co., Inc.,** to resume operations on its Lona mine property on Commencing with about thirty men who are working on a non-union basis. Three cars of coal a day are being loaded, but the company is optimistic of being able to increase production in the near future. [illegible] report for work [illegible] number reported for duty. The mines of the company had been closed down for several weeks. The George Creek Company has delivered to [illegible] operations during a strike and met with a fair degree of success [illegible] to operate [illegible] hand labor.

The George's Creek Coal Co., Inc., has filed a bill in the Circuit Court of Allegany County for an injunction to restrain Francis J. Lynn, President Federal Sign & M. W. Motors and Finishing Co. and [illegible] from [illegible] and operating four [illegible] from [illegible] with employees of [illegible] who refuse to take [illegible].

MASSACHUSETTS

The New England Coal Co. has started work on a new coaling plant in Weymouth. The plant includes a 1,000 ton [illegible] steel and [illegible] with elevating and conveying machinery [illegible].

MICHIGAN

The [illegible] to operate [illegible] and retail coal business established in Detroit in 1892 by the late H. L. Stewart was closed in February, the **H. L. Stewart Coal Co.** has been incorporated to [illegible] with capital stock of $[illegible] all paid in. The officers are [illegible] and treasurer, Harold N. King, vice-president Wallace [illegible], secretary Elizabeth Stewart. Mr. King has been associated with the business since its beginning.

MINNESOTA

The Minnesota Fuel Administrator has completed his report covering the fuel situation from coal facts gathered from the various southwestern part of the state of Minnesota and also those in the north central part at Cleveland. Each report declared the **need of hard coal** to be urgent.

An offer from a North Dakota [illegible] company has been received by the Minnesota Fuel Administrator to furnish [illegible] tons of lignite a day at $[illegible] a ton at the mine.

NEW YORK

The [illegible] office of the branch of the **Maher Collieries Co.** at Cleveland closed up [illegible] will be under the management of **O. E. Sagstad** from that city. **F. B. Sheesley,** [illegible].

OHIO

Frank Collins [illegible] with [illegible] with the H. W. Hampton Coal Co. [illegible] number of years has resigned and will [illegible] as manager of the Home Fuel Co. a [illegible] company in Cincinnati.

The Sunday Creek Coal Co. has declared an [illegible] equal to the **Big Muddy Coal Co.,** of Williamson, Ill., [illegible] Sunday Creek Coal Co. to handle the product. Handling the coal has [illegible] and the Big Muddy Coal Co. has been [illegible] operating this territory.

[illegible] **Cleveland & Western Coal Co.** [illegible]

[illegible] **E. L. Mathis**, manager of the Oakwood Coal Co., at Hagerstown, Md., [illegible] **Ed Towle**, vice-president of the Towle Consolidated Coal Co., Wyatt, W. Va., [illegible] **James A. Reynolds** of the Kanawha Coal Co., Wyatt, W. Va., **J. H. Hanna** and **D. C. Jones** of Huntington, W. Va.; **W. E.** and **David L. Pritchard** of Logan, W. Va., and **E. L. Robbins** of the Low Branch Coal Co., of Jackson, Ky.

Russell Davis, president of the Elk Horn Coking Co., and **Kenneth McKenzie** of the Harlan Coal Co. were recently in the Cincinnati market.

The New Haven Mining Co., Mahaffey, Pa., has been chartered with a capital of $[illegible] to mine coal by W. E. Evans, Albert Evans, Floyd Davis, Rusty Perkins and Elmer Cassell. All of the incorporators are from Carbon Hill.

The Bell Coal Co., Lynchburg, has been incorporated with a capital of $[illegible] to conduct a retail business. The concern was recently conducted as a partnership. Incorporators are Raymond H. Bell, Hope A. Bell, William H. Myers, Desmond H. Bell, Jr., and Bessie A. Bell.

A deal which will **open a great acreage near Pennington Gap, Va.**, has been closed and several officials representing the Hillcrest Coal Co. and other companies and the Burdette syndicate, including the Pendleton estate, which holds title to the property. Conferences have been held in the Cincinnati offices of the Burdette company at which James Honaker, a prominent operator of Pennington, Va., [illegible] president of the Campbell Coal Mining Co. of Knoxville, Robert S. Young, of the Blue Diamond Co., and E. [illegible] Daniels, of Knoxville, were heads of certain interests present.

Recent visitors in the Cincinnati market from the fields were **I. B. Rose**, of Hazard, Ky.; **George Merryman** of the Logan Fuel Co., Charleston, W. Va.; **R. Prettyman**, of the Pine Creek Coal Co., and **Robert S. Young**, of the Colon Coal Mining Co.

The state emergency fuel bill [illegible] for Census passed [illegible] to 11 [illegible] tax for coal shipped in the New [illegible] Ohio Valley Coal Co. and the **George M. Jones** Co. [illegible] for a restraining order to [illegible] the state fuel administrator, [illegible] Davis, and other state officials would be prevented from enforcing the law, [illegible] as the meeting of the hearing in the [illegible] court. These men charge that the [illegible] of threats and coercion and [illegible] with the U. C. C. activities and [illegible] permitted by giving mention of the [illegible] because it failed to file what it was [illegible] to the state fuel officials with [illegible] order.

The Timmons Coal Co., Gallipolis, has sold out to [illegible] at Cincinnati to **Terrick, Hazell & McHose**, a partnership of Gallipolis. The purchasers will continue the output of the mine of about [illegible] tons per month.

A [illegible] petition of the Department of Finance, has asked for bids for about [illegible] tons of coal to be delivered to the various institutions of the state. The new contract is a [illegible] one commencing with the same rate. Bids [illegible] to be opened [illegible] 1. A contract [illegible] will be given each [illegible]

A movement [illegible] petition to one of the local [illegible] coal markets was [illegible] which [illegible] of the organizers and [illegible] have been made on the [illegible] one or more [illegible]

The [illegible] of the [illegible] have been [illegible] **James Honeyman**, who [illegible] has been a resident of the [illegible] and [illegible] of all of the mining [illegible] and [illegible] of the [illegible] [illegible] of the [illegible] [illegible] [illegible]

WEST VIRGINIA

Properties of the **Wyoming Pocahontas Coal & Coke Co.** in Raleigh and Wyoming counties, covering about 31,000 acres in the Sewell and Beckley measures were inspected by a party of officials of the above named company about the middle of November. The inspection was also made with a view to planning for the leasing of the remaining acreage to other operating concerns. Companies having property of the Wyoming Pocahontas Coal & Coke Co. under lease, plan the expenditure of about $5,000,000 toward the development of their properties, the Virginian already having expended about $3,500,000 so as to make possible the development of the property.

Charleston people have organized the **Max Coal Co.**, which will engage in the coal business in Kanawha County, being capitalized at $25,000. Offices will be at Charleston. Having an active part in launching this concern were: E M. Biddison, C. H. Hetzel, D. A. Hogg, Max Moses and W. E. Murrill.

Daniel Howard and others have launched the **Gordon Consolidated Coal Corporation**, of Clarksburg, with a view to operating in Harrison County. This company is capitalized at $100,000. The general office will be at Clarksburg. Others interested in the new corporation are: Hugh Gordon Smith, Paul W. Bailey, Margaret Gibson and George A. Smith, of Clarksburg.

Organization of the **Lubeno Coal Co.** of Wheeling, with a capital stock of $50,000 presages further development of Ohio County coal lands. Interested in this concern are Leo A. Coleman, Vernon Crites, Vernon Travis, Clem E. Peters and D. M. Aikman, all of Wheeling.

Charleston men have organized the **Emmart Coal Co.** of Charleston with a capital stock of $10,000. Active in effecting an organization of this company were: M. C. Jennings, E. L. Estill, L. H. Miller, A. P. Kilburn, N. F. Young, Jim McCreight, all of Charleston.

The Consolidated Gas Coal Co., of Fairmont, a trustee created with John Y. Hite as treasurer and H. H. Staggers as manager, has leased the mine and bought the equipment of Earl and G. Russell Rodgers, who were trading as **Rodgers Brothers**, Clarksburg. The land belonged to the Consolidation company originally, but was leased by the Fairmont Big Vein Coal Co., of which Dan Howard is president. This company sublet the lease to Rodgers Brothers.

The Baldwin Pocahontas Coal Co. will operate on a large scale in McDowell County, headquarters to be at Erin. This company is capitalized at $400,000. It was organized by R. E. Baldwin, Graham; Edwin Mann; Walter Perkins and George P. Crockett, of Bluefield.

The Best Coal Co. will operate on a fairly large scale in southern West Virginia high-volatile territory, having just been launched with a capital stock of $50,000, with headquarters at Charleston. Closely identified with the new concern are: W. A. Reese, J. E. Griffiths, George E. Brown, Roy Cox and G. A. Hinterleitner, all of Charleston.

The Alpha Portland Cement Co. has disposed of its Phoenix coal mine at Wolf Summit, the **Long Coal Mining Co.** taking it over Nov. 16.

Instead of trying the remaining seventy-five defendants charged with the **murder of Sheriff H. H. Duval** of Brook County on July 17, growing out of the attack on Cliftonville on July 17, on a murder charge, it seems probable that the state will elect to **try the remaining defendants on the charge of conspiracy.** It was the original purpose of the state to try the murder cases first but the difficulty of securing a conviction, as demonstrated in the trial of John Kaminski has led the state to indicate that it may alter its plans. There were no eye witnesses to the slaying of Sheriff Duval and it is therefore difficult to fasten the blame on any individual or individuals.

The Morrison Coal Co. will operate on a large scale in Wyoming County and other counties in southern West Virginia, having leased large tracts of smokeless coal. This company has just been organized for the purpose of developing the property leased, and has a capital stock of $500,000. The company was organized by Harry V. Campbell, I. L. Duffield, Fred O. Elue O. R. Purvis, David W. Dunbar, all of Charleston.

Purchase of the **Byrer Coal Co.'s** plant at Byrer, Tigert's Junction, Barbour County from Harry Byrer of Martinsburg and State Senator Hugh Byrer of Philippi is announced by the **Howard Smokeless Coal Co.**, Clarksburg, a new concern, headed by Daniel Howard. The plant has a daily capacity of 1,000 tons and employs 175 men. A new opening will be made.

Increasing its capital stock from $300,000 to $600,000, the **Shriver Coal Co.**, of Morgantown, has devoted a part of its increased capital to the purchase of 300 acres of coal in the Pittsburgh and Sewickley veins, adjoining its present holdings on Scott's Run in the Monongalia field. The price paid for the tract secured was in the neighborhood of $250,000. Eventually the company will enlarge the scope of its operations by installing additional equipment at its tipple. It is also probable that a new opening will be driven to the Pittsburgh vein.

Organization of the **Superior Block Coal Co.**, of Morgantown, with a capital stock of $50,000 presages the development of a tract of coal in Cass District of Monongalia County, west of Cassville, where the new concern has acquired about 200 acres. Previous to the incorporation of the company, work had been started on the erection of a tipple so that it will be possible to initiate operations within a short time. Work has also progressed favorably on the heading. The new company has as its officers, Harold F. Smith, Morgantown, president; Harold G. Hodges, Morgantown, secretary and treasurer. Others interested in the company are Elizabeth Smith, Vesta B. Hodges and Donald G. Lazelle.

Since the purchase of the property, plants and assets of the **Bottom Creek Coal & Coke Co.** by the **Pocahontas Fuel Co.**, of which Isaac T. Mann is president, it is learned the consideration involved was in the neighborhood of $1,500,000. This new plant gives the Pocahontas company seventeen different operations, all but one of which are in the Pocahontas field.

Organization of the **Wise Pocahontas Coal Co.** presages development of smokeless coal land in the vicinity of Welch, which is to be the general office of the company, capitalized at $50,000. Leading spirits in the new concern are: J. W. Strickler, Sadie L. Strickler, W. H. Hatfield, J. W. Price, all of Welch; George R. Hairston, of Iaeger

Following the purchase of a tract of 101 acres in the Bear Mountain section of Harbour County, E. D. Brown and others have organized the **Brown Coal Co.**, which has a capital of $125,000. Flemington is to be the general headquarters of the company. Among those having an active part in forming this concern are, in addition to E. D. Brown: John C. Brownfield, R. W. Henshaw of Uniontown, Pa.; R. J. Brown of Point Marion, Pa.; O. S. Brown of Smithfield, Pa.

Production on a fairly large scale will be undertaken in Harrison County by the **Tygart Valley Fuel Co.**, with general headquarters at Clarksburg. This concern has a capital stock of $100,000. Among those interested in the new enterprise are: E. M. Pendergrast, James G. Kidwell, James Gray, Lloyd Garrett, Jacob Black and O. H. Burgham, all of the Clarksburg.

The following foreign coal corporations, all chartered under the laws of New Jersey, have been authorized by the secretary of state of West Virginia to transact business in the state named. They are the **Blue Ridge Mountain Coal Co., the Barbour-O'Brien Coal Corporation and the Stevens Coal Co.**

The Elk River Coal & Lumber Co., Dundon, has awarded contract to the Phoenix Bridge Co. of Phoenixville, Pa. for six steel bridges for its subsidiary, **the Buffalo Creek & Gauley R.R.** The railroad company recently purchased considerable new rolling stock of heavier type, making it necessary to build stronger bridges to handle the traffic. The road runs from Widen where the mines of the Elk River company are located to Dundon connecting there with the B. & O. giving the coal company an outlet for its products both east and west.

Creditors of the **Mason Coal & Chemical Co.**, of Harford Mason County, having proved for settlement, the entire plant and holdings have been advertised for sale at public auction. The assets of the company are approximately $1,000,000 but claims pending against this concern will practically equal the assets. The company was organized during the war for the purpose of mining coal and for the manufacture of benzine. Just about the time operations were being started on an old and there was no longer any market for one of the principal products of the company.

James A. Burns and George Palmer of Fayette City, Pa. together with West Virginia parties, have incorporated the **B. R. & P. Coal Company**, Fairmont with a capital stock of $50,000.

The Acme Eagle Coal Co. has been organized for the purpose of engaging in the coal business in southern West Virginia high-volatile territory, this company having a capital stock of $10,000. Offices will be at Huntington. W. E. Deegans is one of the principal figures in the new company. Associated with him are J. Frank Grimm, J. M. Turner, J. H. Taylor and O. C. Hoffman.

WYOMING

Heavy storms are [illegible] delaying the surface construction of the **new mine of the M. H. Shields Coal Co.**, six miles from Gillette near the Sheridan field on the Billings line of the C. B. & Q. The coal bed is 99 ft. thick and only about 20 ft. from the surface at the point of attack. Stripping is impractical because it will increase the cover material over most of the acreage. M. H. Shields president of the Bank of Gillette controls the company. **Thomas Hotchkiss** has charge of the mining work.

The Homestake Mining Co. of Lead, S. D., producing the greatest gold mine in the world, has acquired a considerable acreage of coal land near the Shields mine at Gillette. A [illegible] is overlaid by 20 ft. of cover which, with the coal will be mined by a steam shovel strip operation. A model township has been laid out, but heavy snows will delay construction work until spring. H. C. Tate, superintendent of the Homestake will have general supervision, but **Ed C. Ross** will be in actual charge at Gillette.

The Hanna Coal Co. of Rock Springs, recently incorporated with a capital stock of $250,000. The directors named are John W. Hay Mary A. Hay and Logan J. Hay.

The **Community Coal Co.** has filed articles of incorporation. The object is to operate a lease in Platte County. Incorporators are R. E. L. Carroll, president; O. H. Mathews, Evanston, vice-president and general manager; Mrs. M. E. Mathews, secretary-treasurer and two other directors.

CANADA

Construction in Montreal of a **large crushing and screening plant** to handle thousands of tons of [illegible] annually is planned by a group of coal coal importers and dealers who have organized a Welsh colliery firm in the district and have already appointed the Harlow commission in regard to a waterfront site. The scheme was evolved to overcome trouble caused by the recent miners' strike in the United States and is regarded by the brokers as one step in the direction of Canadian independence, so far as American mines are concerned.

The Craig Coal Co., Ltd., recently formed, has opened a wholesale office at Toronto. The head of the company is John Craig, formerly treasurer of the E. B. Wragge Coal Co. and a former secretary of the Toronto Wholesale Coal Dealers' Association.

The William Rogg Coal Co. Ltd. has been organized in Waterloo, Ont., and has been granted an Ontario charter to engage in the wholesale coal business. The authorized capital is $[illegible] and among the incorporators are William Rogg, W. C. Rogg, F. W. Rogg and O. D. Rogg.

A severe "bump" occurred in No. 1 East Mine, **Crow's Nest Pass Coal Co.**, Coal Creek, B. C. on Nov. 14 last. Although haulage and traveling ways in the main entries [illegible] were protected as per mine [illegible] fatal, and only one man was injured. All men in the mine were withdrawn immediately and the working has been closed down temporarily. The management intends to have both general haulage ways [illegible] of Portal a few miles distant.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 22 NEW YORK, THURSDAY, DECEMBER 7, 1922 Number 23

Standardization an Absurdity

WHATEVER may have been in the minds of Messrs. Borah, Winslow et al. when they framed the act creating the United States Coal Commission and called for reports on standardization of prices, margins, wages, the work to be performed, the mines, the cost of living and about everything else, the idea has been pretty well knocked thus early in the game. In turn the bituminous-coal operators, the miners, the anthracite producers and now the retail dealers have shown the absurdity of the undertaking. It has been remarked, for instance, that the first step in standardizing the cost of living is the standardization of wives, and some such impossible foundation must underlie attempts in the other direction directed by the act.

A standardized price, whether for coal or for labor, if it means anything, means a uniform price. A uniform price, to be not confiscatory, must be high enough to permit the marginal producer—the high-cost fellow—to live and profit. Thus the standardized mine prices established by the Fuel Administration (according to the law creating that organization) were uniform by districts and, in order to be high enough to permit the operation of a majority of the tonnage, allowed abnormally high margins for the lowest-cost producers. Under normal conditions of competitive marketing the low-cost operator is prepared to make a lower price and does when the market requires that policy.

The country wants no subsidized, standardized industry and any attempt to set by edict the cost of living and the wage of the worker or the margin, cost, price, and profit of the producer will produce that result.

Threshing Out the Assigned-Car Question

ASSIGNED cars and the related "private" cars have for many years caused dissension between the carriers and the commercial coal operators. There has just been concluded the second set of hearings before the Interstate Commerce Commission on this question with the final round to come in January. The matter is getting the best threshing out it has ever had. For months both the railroads and the coal operators have been preparing for these hearings and the testimony and exhibits introduced have been voluminous. Every opportunity has been given to interested parties to present their views. The commission has given every indication of seeking a solution of the problem.

In a report to the Senate, dated June 11, 1920, the Interstate Commerce Commission said that prior to 1907 it was a common practice for railroads to deliver to coal mines cars privately owned or leased for the carriers' own fuel loading and to refrain from counting such cars in the current distribution. By its decision in the "Hocking Valley" and "Traer" cases in 1907 and 1908 the commission modified this practice, insisting that such cars be counted unless the mine shipped no commercial coal—that is, unless the arrangement with the railroad was for the entire output of the mine. This continued to be the rule until 1918, when the Fuel Administration prevailed upon the Railroad Administration to abandon all assigned cars for railroad fuel coal and instead to put the procurement of fuel in the hands of the former. From the first half of 1918 until April 16, 1920, there were no assigned cars for railroad fuel.

The reinstatement of this method of assisting the railroads to obtain fuel coal was, according to the commission, necessitated by emergency conditions—insufficient supply of cars available for the transportation of coal. At that time the commission recommended "that until experience and careful study demonstrate that other rules will be more effective and beneficial," this practice be continued. The hearings now under way purpose to find the facts and determine whether such rules can be formulated.

Reduced to simplest terms the assigned-car question becomes a matter of price. Railroads in general in the past have enjoyed a lower price for their coal than that charged other consumers. Their argument as to why this should be so was summarized by the Railroad Administration in the early part of 1918 as follows: (a) The demand is permanent; (b) the superior credit of the carriers; (c) minimum sales expense; (d) the railroads store a considerable portion of their requirements; (e) the railroads quite generally own coal lands and could mine their own coal; (f) the commercial fact that all these conditions have been recognized and have had their bearing in securing the uniformly lower price of coal which the railroads have always enjoyed.

Assigned cars are a factor in bargaining for coal. An output contract with preferred car supply that assures continuous full operation is offered as the inducement for low price. The buyer agrees to take all the coal the mine can produce and this arrangement permits operation under the most favorable conditions and with costs lower than if the same mine were to have intermittent operation. When cars are plentiful the demand for coal is dull and there is no necessity for, or advantage in, preferred car supply. But if and when the demand for coal increases to the point where more cars are required for its transportation than the railroads are able to supply and a car shortage results, then the assigned car becomes a factor. The mine that has this arrangement with the railroad works full time, and other mines on the same road, often adjacent thereto, because of lack of cars, are idle or work, as now, but one or two days per week.

Therein lies the cause of complaint and the basis for argument. Just so far as cars for assigned or certain mines are removed from the total available for distribution to all other mines, that much will the cars for loading, and thereby the coal for sale, be decreased at those other mines. Estimates of the percentage by which operating time would be increased by the elimi-

ration of assigned cars and the complete and perfect distribution of cars range upward from it. The figure would vary with the field and be affected by local conditions. In some, if not many, areas where the practice is general the benefit to the nonmercial producer would be substantial. Even those operators who now or in the past have taken railroad fuel contracts with assigned cars are opposing the practice because of the inequalities it introduces.

Not all railroads use assigned cars for the protection of fuel supply. A number of important systems and many small roads have not found it necessary to resort to this practice. Perhaps the real point to be determined is why all roads cannot abandon the practice. If it be true that some roads cannot get coal sufficient for their operation unless they resort to preferred car supply, how is it that others can and do? An imposing array of railroad presidents appeared before the commission in this hearing and testified not only with respect to the reasonableness of assigned cars but their necessity if the roads are not to be required to pay more for coal, which, by inference, is to say if the roads are not to come before the commission with a request for higher rates to pay for the coal. The public may ask as well whether it is being called on to pay more for coal as a result of the railroads' getting it cheaper.

Wage Making and the Sherman Law

NEARLY two years ago indictments were brought before Judge Anderson in the federal court at Indianapolis against more than two hundred coal operators and miners charging, among other things, conspiracy in violation of the Sherman law in making various wage agreements and contracts. These indictments were obtained under a former administration by a former Attorney General. They have only served so far to raise a doubt as to the legality of interstate negotiations between operators and miners.

When the point was raised early this year the present Attorney General is reported to have scoffed at the idea that these indictments presented any obstacle to the operators meeting with the miners. He later took a trip to Indianapolis and talked with Judge Anderson. He had nothing further to say. We have not been informed whether he concluded that the government had such a poor case that it were best left to perish in oblivion or whether some deeper reason prevails for not quashing it or bringing it to trial.

There certainly can be no wage agreement between the bituminous coal operators and the United Mine Workers to take the place of the contract that expires next April unless they negotiate one. The surest way to avoid a strike next year is to have a peaceful settlement prior to that time. The union appears willing to negotiate on any basis save separate districts. Any other involves interstate relations, to all intents of the sort that has been put under the ban by the action of Judge Anderson's court.

No one save the operators indicted—the United Mine Workers appear to hold the matter lightly—is privileged to judge the seriousness of these predicament. If the Illinois or the Pittsburgh or any other operators say that they are not free to negotiate with operators from other states respecting the wages to be paid to the miners of a common union because they are liable to be held to be acting in transgression of the law, who is to say they are not speaking in good faith?

There is but one answer. Let the administration quash the indictments—if not in full, at least in so far as they relate to interstate wage negotiations. Getting government sanction for the method to be adopted in future negotiations is a legitimate enterprise. Certainly the mine owners of this country have been harassed long enough by the uncertainty which has enveloped them ever since the Indianapolis indictments were returned.

If sufficient evidence to justify prosecution on the conspiracy charge has been obtained, then let the case proceed with dispatch and may the arm of the law descend mightily upon the guilty. If it has not, then in the interest of the public good the indictments should be lifted so that they may not interfere with a proper administration of the coal industry's affairs.

The Future of Anthracite

WITH production of anthracite setting new high weekly records, with every man working at top speed and taking in record earnings, this appears to be an inappropriate time to talk about anthracite as an intermittent industry. Such it has been this year, however, because of the five months' strike. Even with production at 2,000,000 net tons per week the country will have but 60 per cent of its requirements of hard coal this winter. Consumers, whether they wish it or not, will this winter learn the values of substitute fuels. Bituminous coal, coke, gas, oil, each is having its innings in homes, apartment houses, hotels and theaters where never before had any fuel save anthracite been used.

Let us assume that next year the hard-coal miners obtain a renewal of their present wage scale, if nothing better, and the selling prices of the coal they produce remains as high as now, if not higher. Many of those whose experience with substitutes is not unfortunate this winter will hold on to those substitutes. The demand for hard coal will be decreased, particularly for the sizes now most in demand—stove, nut and range. With decreased demand the business of mining will cease to be a full-time occupation. The miners will then demand higher daily and tonnage rates of pay to compensate for short time and the cost and the price will further ascend. The country may thus become accustomed to using some fuel other than hard coal before the limited deposits are exhausted. Coal this country must have, but it may find that it can get along with mighty little anthracite.

Operators show more concern over this than the miners, because they have a fixed heavy investment whereas the miners may more readily pull up stakes and depart for other jobs. It will be a sorry day for the hard-coal industry when the only hope of full-time operation lies in having a strike to reduce supplies and make the consumer coal hungry.

WHILE THE UNITED STATES cannot hope to compete with the low-cost countries in the manufacture of the simpler forms of machinery which are not made on a large scale, there is increasing evidence that this country can compete in any market with machinery which is made in large quantities and with such articles as machine tools, typewriters and locomotives, which are developments of American ingenuity.

WHAT INTERESTS THE CONSUMER is not the number of square miles that contain coal but the number of square people that sell coal.—*Indianapolis Star.*

Pumping the Big Muddy River Out of a Mine to Save Machinery and 300,000 Tons of Coal

Roof Caves Under Flood Extension of River and Water Pours Into a Mine at Murphysboro, Ill.—Big Pumps and Water Hoist Work Months Ejecting Five Million Gallons a Day—Mine Is Saved

By C. L. Moorman*
St. Louis, Mo.

IN THE latter part of the year 1920 the Consolidated Coal Co. of St. Louis acquired the operating coal mines in Illinois of the Big Muddy Coal & Iron Co., including mine No. 9, situated at Murphysboro, which had long borne an enviable reputation for the quality of its product. Coal seam No. 2 is extracted at this mine, a characteristic section of the coal and overburden showing a 6-ft. seam of coal, overlaid with 1 to 3 in. of draw slate under a gray-slate top. Under the coal bed lies 1 in. of fireclay on sand rock. Room-and-pillar methods of mining, in which 6 in. of coal was left under the slate roof, had been followed under the former ownership and were continued by the purchasing company.

The area to be mined from this shaft is traversed on the north and west by the channel of the Big Muddy River, a stream which not only has an unusually flat drainage slope, in this territory averaging only about 5 in. to the mile, but one which is subject to wide and frequent variations in water level. On account of its proximity to the Mississippi River, the Big Muddy at this point is affected by fluctuations in the level of the larger stream.

In the development of this mine, in order that a large body of coal might be entered lying between the river and abandoned mine workings, two main entries had been driven under and across the river bed, one to the north, the other westerly. Gathering was done by mules; three electric locomotives were used for main haulage and the coal was undercut by ten electric mining machines. Twelve electrically driven pumps and three steam pumps were used to eject water from underground, the mine making normally about one million gallons each twenty-four hours. The depth of the hoisting shaft is 115 ft. from the ground surface to the rail at the caging point.

The surrounding surface is rolling prairie with sharp breaks where side streams join the river, much of it considerably lower than at the shaft. The coal seam

*Chief engineer, the Consolidated Coal Co. of St. Louis.

The headpiece shows a lake almost [illegible] formed when the water broke into No. [illegible] of the Big Muddy Coal & Iron Co. The photograph from which the drawing was made was taken after the river receded. The hole leading down into the mine workings, is at the far end of the lake.

undercroath also presents many variations from a horizontal plane. The shallow cover over the coal bed is easily penetrated and many holes for pump columns have been drilled, so that underground pumps may be advantageously placed without resort to long pipe lines.

For many years the men employed at this mine have suspended work when the stage of water in the river reached a certain mark, resuming operations when the water had receded. The objection to working under flood water appears to have been based upon the fact that bad roof had been encountered years ago in some of the most extended workings and not because of any actual unusual seepage of water into the mine. As a rule the Big Muddy rises above the specified mark several times during each year, and such rises occur at any time—there is nothing regular in the flood periods of the Big Muddy.

On Nov. 18 last year the water had reached the point regarded as the limit for safe operation, and work was suspended. One week later the stage of river was 15 ft. above the mark, this being the highest point reached during that particular flood. Five days later the river had fallen 5 ft., but back water still filled all the side streams. Suddenly on this date, at about 3 o'clock in the morning, the river forced into the mine. The underground commotion and uproar was audible to two men who were at the shaft bottom completing a night inspection tour and who were in the act of hailing away the cage for the top.

They were hoisted safely, but within two hours after the break the water rose inside the hoisting shaft to the same level as that of the water in the river, this being 23 ft. below the ground landing. As the river continued to recede in its customary channel a systematic search for evidence on the surface of the ground of the connection between the river and the mine was begun two days later. When found this exhibited itself as a small "lake" about one acre in extent, with fallen trees around the margin and an ebullient surface near the south end, where escaping air bubbled up from the mine. The force of this escape was shown by several geysers in the river where air under enormous pressure had broken through to the surface.

On the morning of Dec. 3 the river had fallen to a plane below the outlet of a small creek along the bed of which the "lake" formation appeared, thus forming a barrier between "lake" and river. The water remaining in the "lake" quickly disappeared into the mine, and opportunity was afforded to examine the position and extent of the damage.

The break in the roof occurred at the extreme edge of long-abandoned work at the northeast corner of the mine, about 400 ft. from the normal water's edge of the Big Muddy. At this point about 40 ft. of earth rested on top of the slate. The terrific inrush of water from the river channel undermined the sides of the creek, carrying the earth into the mine until a chasm about 120 ft. wide and 350 ft. long was produced. Approximately 25,000 cu.yd. of earth disappeared into the underground, together with the small trees and brush with which the acre of territory was covered. The larger trees on each side of the creek fell into and across the depression as the sides assumed verticality from the force and cutting action of the rushing water.

Fearing that another rise in the river again would fill the surface sink with water a hurried attempt was made to block with layers of brush and timber mattresses and earth the opening in the slate roof, which appeared as a ragged roughly rectangular hole measuring about 10 x 12 ft. Subsequently the underground passages leading from the hole in the roof were solidly blocked with timbers, earth and hay. The lake has been full of water for months now, and no perceptible leakage has occurred.

With the cessation of inflow from the river the water level in the hoisting shaft began falling until on Dec 9 it had reached a depth of 86 ft. below the ground landing, a fall of 63 ft. from its highest point. This disappearance of the water from the "lake," being concurrent with the lowering of the level of the water in the shaft, indicated that the stoppings were giving away under pressure and that the old mined-out sections were being flooded. As it was impossible to determine with any semblance of accuracy how many or how few of the underground chambers had been filled with water it was assumed that the mine was entirely flooded, and in that event it would be necessary to pump out about two and a half billion gallons of water (in addition to the normal leakage of one million gallons per day), a rough estimate subsequently proved to be far too large.

To raise this immense volume of water, unusual methods were necessary. Two stout wooden boxes were constructed 7 ft. 4 in. long, 4 ft. 7 in. wide and 3 ft. deep, with hinged horizontal flap valves on their bottoms for the entrance of water and with hinged end gates opening inwardly and operated by double crank mechanisms. The cages were dismantled, and the water boxes hung in the regular cage side irons. Water was hoisted continuously until the bottom landing was clear, so that the mine could be entered from the hoisting shaft. The filling and the discharge of the water boxes was automatic, and an average speed of three hoists per

THEY SAID IT COULDN'T BE DONE

When the news went around that the Big Muddy River in southern Illinois had broken through into the No. 2 mine of the Consolidated Coal Co. of St. Louis and had filled it almost to the shaft top, engineers said the mine was a goner. When W. J. Jenkins, general manager, and C. L. Moorman, chief engineer, began pumping and hoisting water, the engineering fraternity smiled and said they admitted the nerve of these men, but who could save an old mine with an immense cavern torn from the surface clear down into the workings? And anyway it wouldn't be worth the tremendous cost.

But these two men had pumped water before. The mine normally makes a million gallons a day. They were staggered but not whipped when they figured that two and a half billion gallons of flood plus the regular million daily gallons would have to be ejected. The cost might be $75,000. But down in the mine were 200,000 tons of good Murphysboro coal and machinery and trackage worth at least $50,000. So they went after it, working their three pumping shifts 24 hours a day for months. They found the job less than they had figured. And they won.

The 200,000 tons of coal is now coming out of the shaft at the rate of 1,000 tons a day. The motors and other "drowned" machinery, still worth $20,000, have been rebuilt and are in use, and the chasm yawning from the surface down to the coal is so successfully plugged at the bottom with timbers and mattresses of brush, baled hay and dirt that there is not even a sizable seepage, although summer floods have filled this great crater and it stands as a vast, threatening tank directly over the works. The whole cost of the dewatering was something less than $25,000.—EDITOR.

FIG. 2—FULL-GROWN TREES FELL INTO THE CRATER

As much as 25,000 cu.yd. of earth disappeared into the mine. When this hole had been emptied of water down to the level of the coal a puncture 10 ft. in diameter was revealed extending through the 8 ft. roof of slate. This was stopped with logs, mattresses of brush, baled hay and a vast quantity of dirt. Floods since then have filled the hole but no water has leaked into the workings.

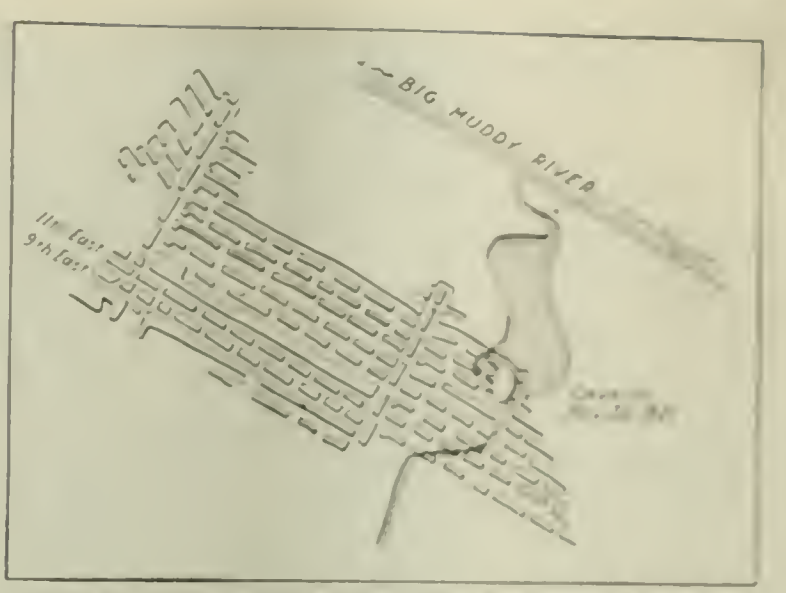

FIG. 3—MINE WORKINGS AROUND THE CAVE IN

The break occurred under the bed of a little creek which crossed the northeast corner of the mine above entry abandoned workings. The swirl of water going down the hole excavated the lake shown in the creek bed.

minute was maintained. One engineer ordinarily made four per minute. Some water slopped over the sides of these hoist boxes and leaked out, so that the average quantity brought by this method to the discharge point was 700 gallons per hoist, or 2,100 gallons per minute.

Soon after this installation began work an electrically operated centrifugal pump was placed on a platform just above the water surface in the airshaft. This pump discharged 1,400 gallons per minute to the surface. Working twenty-four hours, about five million gallons per day was now being discharged.

Nine days after the flooding of the mine, pumping operations were begun, continuing from Dec. 9 to Feb. 7 uninterruptedly, except for minor delays. On the latter date the water level had been lowered to the underground landing and the hoisting of water was discontinued. A record of changes in the water level, gaged in the shaft at the same hour each day, is appended (Fig. 6).

When it is remembered that practically the same quantity of water was being ejected daily, the wide fluctuations in surface level indicate that the flow of water to the mine bottom was often obstructed. On four widely separated dates—Dec. 13, Jan. 8, Jan. 26 and Feb. 5—the water level remained stationary. On Dec. 19, Jan. 16, Jan. 30 and Feb. 1 it reached a higher level than that recorded on the preceding day, the largest increase being on Feb. 1, when the water rose more than 2½ ft. in spite of pumping.

As soon as the shaft bottom was clear of water the three steam pumps near the shaft were reclaimed and put in operation, a second centrifugal pump of 1,200 gallons per minute capacity was installed inside the mine, followed by a third centrifugal of 700 gallons per minute capacity and a fourth of 1,200 gallons per minute capacity, so that for several days, or as long as a large volume of water was accessible, the maximum ejection of 7,000,000 gallons per day, or more than 29,000 tons, was attained.

As the recession of the water level continued, and as high points along the haulageways emerged, a number of disconnected pools were formed and further dewatering became merely a problem of moving pumps from place to place to keep in contact with the receding water, minimizing the length of discharge lines by

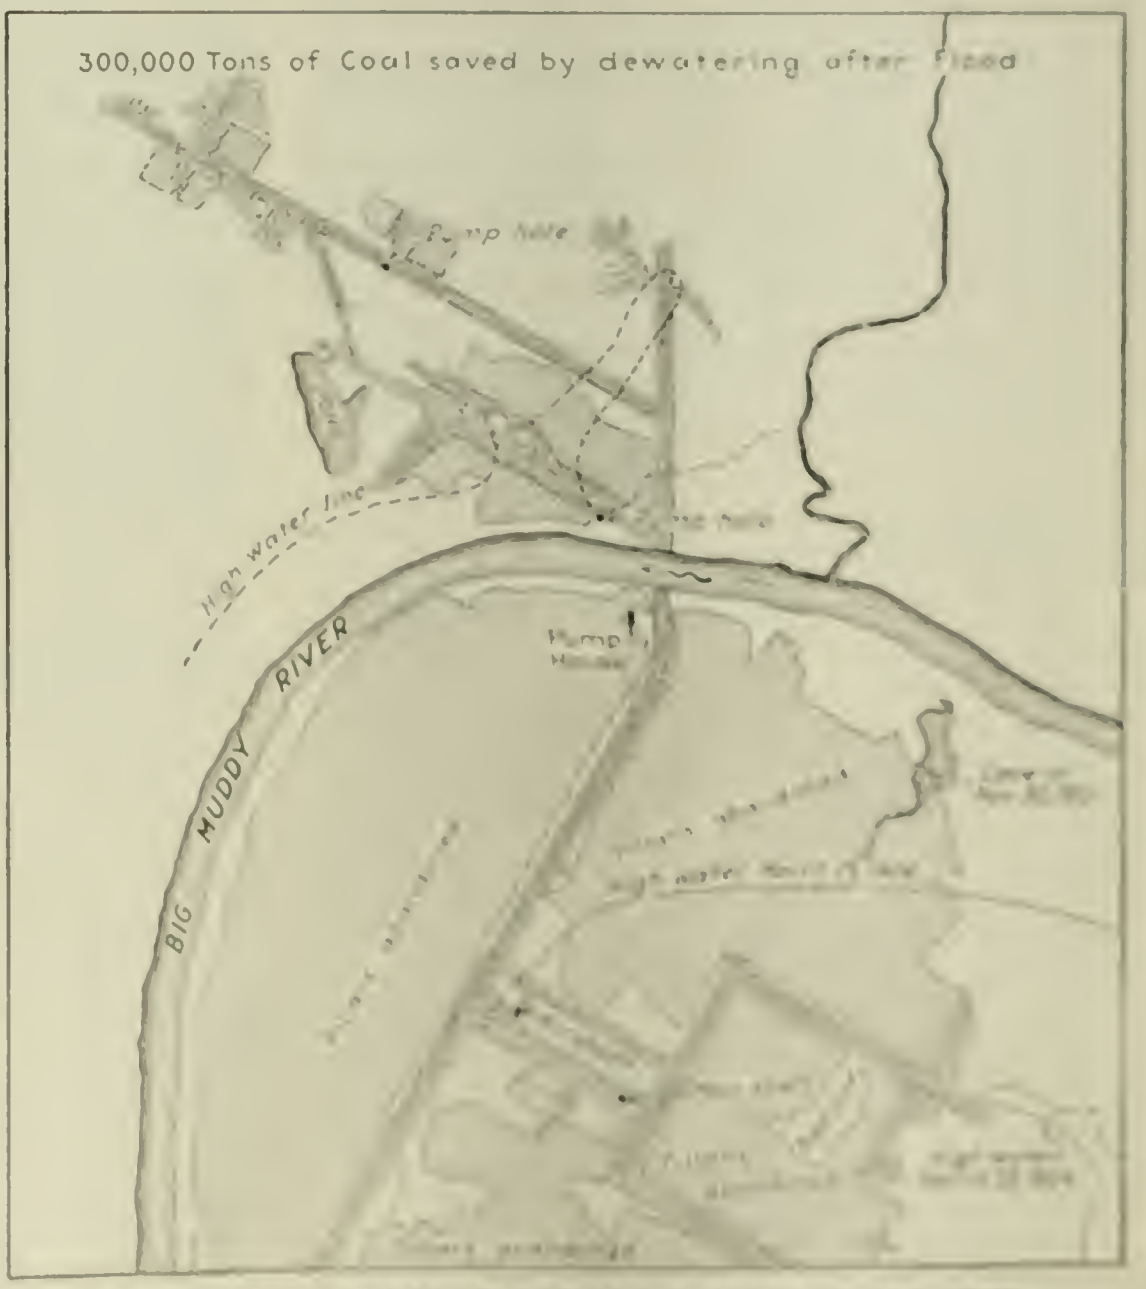

FIG. 4—MAP SHOWING LESS THAN ONE-TENTH OF THE MINE

This shows the position of the mine with respect to the river during the flood, when nearly nine square miles of the surface above the mine were under water. Workings were still under the river when the mine was pumped out.

drilling from the surface in the most economical positions a few additional pump-column holes.

The greater part of the flooded electrical machinery has now been recovered. Three of the reclaimed electrically driven pumps have been repaired and are now in operation. Isolated pools of water remained in dips and were removed with small pumps, which was a rather slow process, and a large part of the underground tracks was covered with mud, though of this and of débris it would seem that only a remarkably small quantity had to be removed in view of what a large body must have entered with the water.

Practically all the former live workings of the mine are now open and dewatering is essentially completed for that part of the mine in which future operation is planned. A few small slate falls to be cleaned up and a number of broken stoppings to be rebuilt represented about all the damage the mine itself suffered. The engulfed motors and some of the other equipment had to be rebuilt, however.

During the nearly seven months of pumping about one billion gallons of water was removed, and the quantity remaining in abandoned workings does not threaten or endanger any part of the live workings.

THE VERTICAL CARBONIZING OVEN constructed at Grand Forks, N. D., in the course of a co-operative investigation by the University of North Dakota and the U. S. Bureau of Mines looking toward the commercial utilization of the northwestern lignites, has recently been operated under the supervision of W. W. Odell, fuel engineer of the Bureau of Mines, in the manufacture of lignite char on a commercial scale. Results were quite satisfactory and valuable information on the production of lignite char without the recovery of byproducts was obtained. The cost of producing this char was reduced considerably below the cost of operation in the carbonizing oven used in 1921. A satisfactory grade of char was produced. Grates for the utilization of this char in the ordinary magazine-feed house-heating stove and for a house-heating boiler have been made at Pittsburgh and sent to North Dakota for distribution to domestic consumers.

THE METHOD OF COLLECTING mine samples of coal by the Bureau of Mines involves selecting a representative face of the bed to be sampled; cleaning the face; making a cut across it from roof to floor, and rejecting or including impurities in this cut according to a definite plan as they are included or excluded in mining operations; reducing the gross sample, by crushing and quartering, to about 3 lb.; and immediately sealing the 3-lb. sample in an air-tight container for shipment to the laboratory.

Comparison of Froth with the Trent Process*

Flotation About as Effective as Trent Process on 65-Mesh Coal of Pacific Northwest—Latter Method Does Better Work on Slimes—Amalgam Water-Free and When Made with Fuel Oil Can Be Burned Economically

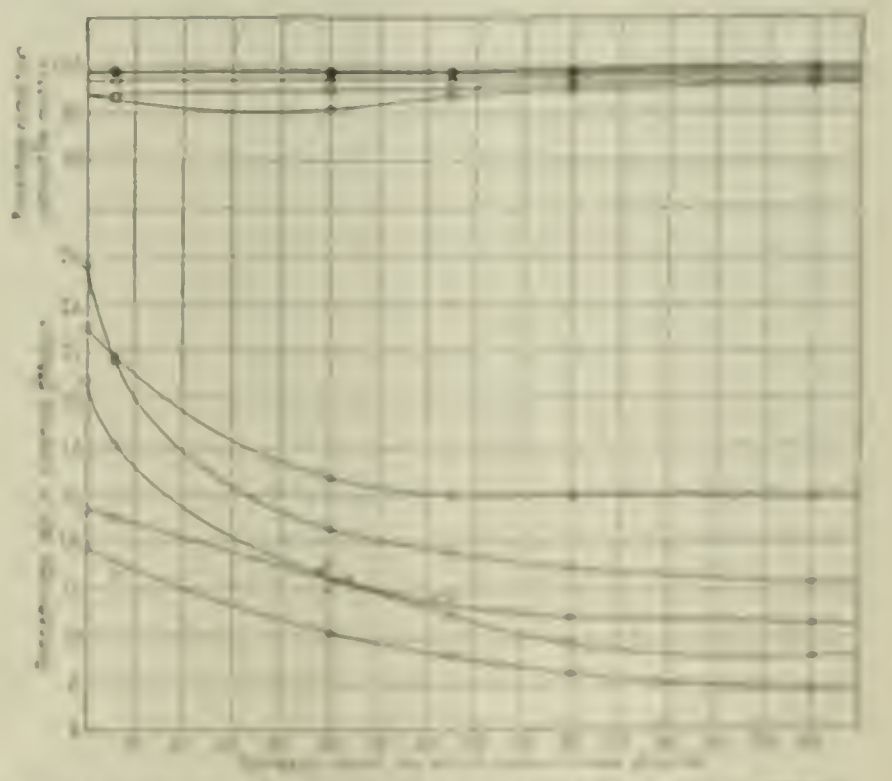
By Oliver C. Ralston†
Washington, D. C.

FOR several years the Bureau of Mines experiment station at Seattle has been engaged in a study of washing the coals of the Pacific Northwest, and as one phase of this study the flotation of the fine sizes of coal on oil froths was made by one of the research fellows‡ of the College of Mines, University of Washington.

Simultaneously in 1920 the Trent Process Corporation was testing representative samples of coal from all portions of the United States and arranged for tests to be made in three places—one in Washington, D. C., at the laboratories of the U. S. Bureau of Standards; one in Pittsburgh, Pa., at the experiment station of the U. S. Bureau of Mines, and one at Berkeley, Cal., at the experiment station of the U. S. Bureau of Mines. The Northwest Experiment Station was requested to send representative samples of the Washington State coals to the three laboratories where the Trent process work was performed, and did so, quartering the samples and saving a sample itself on which to make froth flotation tests for purposes of comparison with the Trent work.

The Trent process work done by the U. S. Bureau of Mines at Pittsburgh has already been reported§ by Perrott and Kinney. Unfortunately, only the work done at Berkeley is directly comparable to the Seattle froth-flotation work, for the reason that the Seattle work was done on coal crushed to 65-mesh whereas the Trent work carried on in Washington and Pittsburgh was done on more finely ground coal, usually 200-mesh. At Berkeley the experimenter employed by the Trent Process Corporation, A. H. Heller, tried the Trent process on these 65-mesh samples of coal after grinding them to a series of different sizes. In this article only those Trent process tests will be reported which are directly comparable to the froth-flotation tests, the former being abstracted from Mr. Heller's report.

Froth Flotation Not Suited to Slimes



It should be pointed out, in all justice to the Trent process, that it is not limited to the treatment of such coarse coal but seems to work very well on the finely divided slime. Therefore, this comparison is really made only on coal crushed to give reasonably satisfactory work by froth flotation, overlooking the fact that these may not be the best conditions for the Trent work. This will be seen on looking over the figures given in the following paper.

As is well known, froth flotation is one of the modern methods of separating finely divided materials. While the Trent process is even more modern in its development it greatly resembles some of the old "bulk oil" separation processes that preceded flotation. Oil amounting to from 30 to 50 per cent of the weight of the coal is added to a suspension of finely divided coal in water and stirred up with it.

The oil passes into or is absorbed by the coal or the carbonaceous matter, the ash remaining in the water. By a variation in the degree and duration of agitation of the pulp and the quality and quantity of the oil, the resultant "amalgam" of coal and oil can be made either to float or to sink. By prolonged agitation, the time varying with the materials used, the amalgam will collect into little spheres which are well formed and fairly strong so that they can be screened from the pulp or otherwise removed mechanically.

There is a more or less definite ratio of combination between the oil and the coal, and by using the bare minimum of oil the amalgam can be made quite hard. Any excess of oil makes the amalgam softer and more oily, whereas the hard amalgam frequently does not even feel oily. These little spheres of amalgam call to mind the old Cattermole granulation process which immediately preceded froth flotation. Where heavy, cheap oils are used they need not be separated from the coal. Hence the Trent "amalgam" may be used directly as fuel and consequently the "bulk-oil" concentration of coal is not subject to the limitations that were found when ore was thus concentrated, for in that case the large quantity of oil left in the ore concentrate made the process expensive.

The samples taken represented the whole range of

coals between black lignite (low-grade sub-bituminous) and semi-anthracite and were characteristic of the Pacific Northwest coals in being boney or high in inherent ash. It had been hoped that fine grinding would liberate the ash, but it was found that even the very finest grinding attainable commercially (300-mesh) still left a high inherent ash in all the samples. These had been gathered by A. P. Wichmann, who held a graduate fellowship in the University of Washington and who also performed most of the flotation tests herein reported.

Sample No. 1 is a low-grade sub-bituminous coal from the Mendota Coal & Coke Co. property, Mendota, Wash. Sample No. 2 is a good sub-bituminous coal from the Issaquah mine of the Pacific Coast Coal Co. Sample No. 3 is a bituminous non-coking coal from the Carbon No. 10 seam of the Carbon Hill Coal Co., Carbonado, Wash. Sample No. 4 is a bituminous coking coal from the Wilkeson Coal & Coke Co. property, Wilkeson, Wash. Sample No. 5 is a semi-anthracite coal from the South No. 3 seam of the Carbon Hill Coal Co., Carbonado, Wash. The proximate analyses of these samples are given in Table I.

The flotation tests were made in a small "Minerals Separation" type of flotation machine capable of treating 1,000 g. of ore. A number of tests were made on

TABLE I—ANALYSES OF PACIFIC NORTHWEST COALS USED IN SEATTLE AND BERKELEY TESTS

No.	Kind of Coal	Moisture, per Cent	Volatile Matter, per Cent	Fixed Carbon, per Cent	Ash, per Cent	Moisture and Ash, per Cent	
1	Low-grade sub-bituminous	14.81	12.75	39.47	34.29	9,385	13,230	53.18
2	Good sub-bituminous	6.04	14.74	35.82	34.46	9,580	13,420	52.30
3	Bituminous, non-coking	2.11	23.86	29.35	42.64	10,705	14,600	40.80
4	Bituminous, coking	1.48	24.39	30.08	53.95	11,216	15,135	37.90
5	Semi-anthracite	2.86	13.43	11.13	71.44	12,745	15,065	13.15

each coal, using various oil mixtures and varying the physical conditions, for it had been found that coals, like ores, react to flotation differently and that, in consequence, the best conditions must be found for each case. Only the tests made under what proved to be the better conditions are herein reported.

In preliminary tests great difficulty was found in obtaining clean flotation with finely-ground coal and consequently the tests were made with coal ground to a fineness that would enable it to pass a 65-mesh sieve. The Trent tests by Mr. Hofer were made on coal in a whole series of sizes, so that by interpolation of his figures it was possible to get the figures on the Trent process when operated with a 65-mesh coal, thus making it possible to compare the results made with this process with those attained when using froth flotation.

The flotation froth was divided into two parts; the first portion was regarded as more or less clean concentrate and the second was regarded as middlings. Laboratory work has proved that the clean coal tends to float first and that the more boney coal then follows, so that our middlings may be regarded as representing the more boney fraction of the coal.

The figures that have been compared with the Trent figures are the average analyses of the first and second froths together with the total extraction of combustible matter made in these two froths. Frequently the second froth was very high in ash and when averaged with the first froth gave a final concentrate that was

TABLE II—RESULTS OF FROTH FLOTATION TESTS, PACIFIC NORTHWEST COALS

higher in ash than was found necessary by parallel tests in which not so much boney coal was allowed to float. Some of our tests were made without producing a second concentrate but merely first concentrate and tailing. The froth-flotation results used for comparison with the Trent process work are contained in Tables II and III.

The Trent process tests on 65-mesh coal—the same sizing as that used for froth flotation work—were made with a heavy thick fuel residuum oil. No light oils were tried in these tests, but in working with 300-mesh material, results obtained with light oils were far better than those in which heavy oils were used. This is shown in Tables V and VI. The quantity of ash retained in the final product increases with the viscosity of the oil, and the final combustible recovery decreases somewhat.

From this one is led to believe that if in the Trent work on 65-mesh coal, instead of fuel residuum, oils of a viscosity similar to those employed in the froth-flotation tests had been used, the resultant oil-coal Trent product would have been much lower in ash than is shown in Table IV. In the work at Berkeley the Trent Process Corporation experimenter decided to center his attention on the use of heavy oils, owing to their low cost and the fact that the final product could be used directly as a fuel. When using the more expensive lighter oils, the final product must be subjected to a low-temperature distillation for the recovery of the oil, and this was one phase of the Trent process which it was decided to leave for later work. Another phase of the Trent process where heavy oils are used, and which was studied in detail from a laboratory standpoint at Berkeley, was the complete distillation of the final product with the recovery of oil from both the coal and the oil of the amalgam. This latter work will not be reported here.

The coal was ground to pass a series of progressively finer screens and treated with the proper portions of water and fuel residuum oil in an agitator until the coal had passed into the oil and the ash was left in the water. They were then separated and the two products analyzed. The percentage ash in the cleaned coal was determined and from this the percentage recovery

TABLE III—OIL MIXTURES USED IN FROTH FLOTATION TESTS

Coal Sample No.	Oils	Lb. per Ton
1	4 kerosene to 1 pine oil	6
2	5 kerosene to 1 hardwood tar creosote	6
3	Creosote pine creosote	4
4	Creosote pine creosote	2
5	Kerosene	4
1	Pine oil	1.5
4	Mixture X-mineral solvent	3
3	Pine oil	2.5
5	Kerosene	2

of combustible materials was calculated on each test. All of the combustible recoveries were well over 95 per cent and are presented in the curves at the top of Fig. 1. The percentages of ash in the various products are plotted in the lower set of curves of Fig. 1, and the numbers of the coal samples are given in the right-hand margin.

From these curves the data on the behavior of coal ground to pass a 65-mesh screen were interpolated.

The average results of the froth-flotation and Trent heavy-oil tests are given in Table IV, which assembles side by side the percentage of ash in the concentrate and the percentage of recovery of combustible material when the various coals are crushed to 65-mesh and treated by the Trent process or by the froth-flotation process, each using suitable oils.

In Table V are shown also the Trent process results on coal ground to pass a 300-mesh screen, which probably is the limit of any possible commercial grinding, giving a comparison of results with the heaviest and the lightest oils employed. The results with fuel residuum in Table IV on 65-mesh may be compared with the same oil in Table V on 300-mesh. Table VI shows the results in the use of different grades of oil.

With the exception of sample No. 2, which was refractory to froth flotation, the grades of concentrate

TABLE IV—COMPARISON OF WORK DONE BY TRENT AND FROTH-FLOTATION PROCESSES

	Tent Process				Flotation	
	300-mesh		65-mesh		65-mesh	
Coal Sample	Concentrate Ash, Per Cent	Coal Recovery, Per Cent	Concentrate Ash, Per Cent	Coal Recovery, Per Cent	Concentrate Ash, Per Cent	Coal Recovery, Per Cent
1	9.0	99.5	13.5	99.0	13.8	90.4
2	10.6	98.0	13.5	98.0	15.5	80.0
3	12.2	98.0	16.3	96.0	18.4	90.0
4	15.8	99.5	18.0	98.5	18.8	96.0
5	7.7	99.5	10.8	99.0	10.7	97.0

produced by the two processes where fuel residuum is used for the Trent work are very similar, the Trent process seeming to have a slight advantage. In every case the recoveries of the combustible matter were better by the Trent process than by froth flotation. Froth-flotation recoveries were over 95 per cent for the two highest-grade coals (semi-anthracite and bituminous coking) but were lower for the lower-grade coals.

By examining Table II, however, it will be seen that the froth-flotation process can remove part of the coal in a first concentrate which will be much lower in ash than where a single bulk concentrate is made. In other words, the cleanest coal floats first and later the more boney coal. In this manner a cleaner product can be made by froth flotation than that shown in Table IV if recovery of combustible matter is sacrificed. The Trent process makes only one separation: combustible material and relatively clean ash residue. It does not provide any middlings. In other words, most of the bone or boney coal is collected with the clean coal. On the 65-mesh coal tested the first fraction of the flotation froth was lower in ash than the Trent amalgam. Each process evidently has its advantages over the other.

Where it is permissible to burn the mixture of oil and coal produced by the Trent process, froth flotation would be at a disadvantage, as it would be necessary to dewater the concentrate before it could be burned. Where the oil used for the Trent process is too valuable to be used as a fuel, however, it must be recovered and in comparison it probably is easier to dewater and dry a froth-flotation concentrate than it is to distill

TABLE V—TRENT PROCESS TESTS ON 300-MESH COAL

Coal Sample	Fuel Residuum: Concentrate Ash, Per Cent	Fuel Residuum: Coal Recovery, Per Cent	Gasoline: Concentrate Ash, Per Cent	Gasoline: Coal Recovery, Per Cent
1	9.0	98.9	8.10	87.77
2	10.55	98.5	8.95	86.60
3	12.2	97.4	8.80	81.65
4	15.80	98.45	12.80	90.70
5	7.50	99.40	6.15	89.59

and condense the oil from a Trent "amalgam," leaving the coal behind. But where oils of this type are used the final coal is lower in ash than that obtained from flotation.

The ability of the Trent process to operate successfully on finely ground material gives it an advantage over froth flotation, which latter process seems to meet difficulties when treating finely ground or slimed material. On material between 10- and 100-mesh froth flotation promises to be a strong competitor of the coal-washing table. The table does not do very good work on the sizes smaller than about 48-mesh. The way to float 200-mesh coal on an oil froth doubtless will soon be discovered, however, as there are already several promising lines of attack in sight.

It is probable that the laboratory test of the Trent process could be profitably used by froth-flotation experimenters as a check on their work, as the Trent result would represent the best grade of concentrate that could be made consistent with a high extraction of combustible matter, and thus afford a criterion by which to judge the perfection of the froth-flotation tests.

Where clean, finely divided coal is wanted for diluting fuel oil, as used for combustion purposes, the Trent process probably will find an important field. However, for boney coals, which are not cleaned by the Trent process as much as is desirable, the floating of the clean portion of the coal by froth away from the boney portion will give a froth concentrate which can be mixed with the fuel oil immediately, allowing the clean coal to pass into the oil and thus getting rid of the water without filtering or drying the froth concentrate. In this way the two processes could supplement each other.

From the preceding it can be seen that one of the most important things to consider in comparing the two processes from a commercial viewpoint is the use to which the coal concentrate can be put. The froth-flotation concentrate has been used in a number of collieries in England, but so far only in preparing coking coal. A Trent-process plant is now in operation at Alexandria, Va., producing amalgam direct for the market, and several hundred customers are trying it for various purposes, such as industrial fuel, firing boilers, furnaces, etc., as well as for bakers' ovens, glass works, fertilizer works, and even cooking stoves in hotels and restaurants. As a domestic fuel it may also prove to be of great interest, as it is said both to ignite easily without the use of kindling (requiring only a little paper) and burn without forming clinker.

TABLE VI—TRENT TESTS OF NO. 5 COAL, WITH VARIATIONS IN KIND OF OIL USED

Kind of Oil	Relative Viscosity	Ash Obtained, Per Cent	Fuel Ash, Per Cent	Coal Recovery, Per Cent
Gasoline	0.61	10.8	8.8	91.49
Crude kerosene	0.87	10.8	8.4	90.04
Kerosene	1.0	10.8	8.5	89.16
Mixture (kerosene) oil	1.5	10.8	8.4	85.04
Mixture (crude oil)	2.0	10.8	11.4	89.04
Fuel residuum	46.6	10.8	12.1	87.49
Mixture (engine oil)	Very high	10.8	12.1	86.55

It is being used also in the manufacture of municipal gas. From the foregoing these conclusions may be drawn:

(1) Froth flotation and the Trent process, when applied to the cleaning of various coals ground to pass a 48-mesh sieve for the purpose of preparing a low-ash fuel, gave very similar results under conditions which were most favorable to the froth-flotation work and somewhat unfavorable to the Trent work.

(2) Under these conditions the grades of concentrate made by the two processes were almost identical for all kinds of coals tested, with a slight advantage in favor of the Trent process when heavy oils were used and a pronounced advantage when light oils were used.

(3) The extractions of combustible matter are higher in the Trent process, the difference being slight for semi-anthracite and coking bituminous, but up to 8 or 10 per cent for the lower grades of coal.

(4) The Trent process carries the lumpy coal into the "clean" coal product whereas it is possible by froth flotation to carry the cleanest coal into a first concentrate and the boney coal can then be taken off in a second concentrate, which can be segregated, if desired. For this reason the froth-flotation process is the more flexible of the two.

(5) The Trent process has been operated successfully on material that has been ground to pass a 300-mesh screen, whereas froth flotation has been successfully used to date only on material ground to pass a 65-mesh screen, although good flotation work can be done on all sizes of coal but the "slime."

(6) The question of disposal of the concentrate is most important in considering the value of a process and though each process is now in use the field of usefulness of the two products is still largely to be determined; it is possible that the two processes could even be used to advantage to supplement each other.

(7) As at present developed froth flotation is competing with the coal-washing table for cleaning fine granular portions of coal, whereas the Trent process is in use for the more finely divided and slimed coal.

20,000,000 Tons of Byproduct Coke Produced During 1921

Byproduct coke and coke byproducts produced or sold during 1921 in the United States, according to final returns from all operators to the U. S. Geological Survey, amounted to almost 20,000,000 net tons, which was the Survey's earliest estimate of production for the year. Nearly 29,000,000 tons of bituminous coal was charged into the ovens for making this coke, and there was produced from this coal also 1,800,000 net tons of screenings or breeze.

Some of the salient figures for this industry are given by R. S. Moffatt in the following statement, which shows the extent of the development of the industry by the addition of new ovens and the present maximum capacity of the industry for the production of coke.

TABLE I—SALIENT FIGURES OF BYPRODUCT COKE INDUSTRY IN 1921

Ovens—	
Constructed (Jan. 1, 1921)	11,141
Now under construction during year	483
Under construction at end of year	85
Ovens capable of operating continuously at end of year—	
Daily capacity of coke	120,149
Annual capacity of coke	43,854,385
Coal charged into ovens—	
Quantity (net tons)	28,813,111
Average value per net ton	$4.82
Byproduct coke produced (net tons)	19,749,580
Average yield of coke from dry coal	68.5
Coke used for operating coke ovens	13,470,336
Breeze and fuel coke made—	
Quantity (net tons)	3,129,769
Average value per net ton	$7.47
Coke sold—	
Quantity (net tons)	3,678,811
Average value per net ton	$8.22
Breeze sold—	
Quantity (net tons)	1,831,110
Used in producer-run ovens	1,472,810
Sold (net tons)	295,867
Average value per net ton	$2.10

Statistics for each state regarding coal charged, byproduct coke produced, screenings or breeze produced, and the value and value of sales during the year are given in Table II. More than half the coke produced is used by furnaces with ovens as a part of steel or pig-iron plants. Nearly all the coke produced in these plants is used by the producers and is therefore not reported in these tables as sold. The difference between production and sales thus is very large. A considerable part of this difference also was lost, but probably not over 10 to 15 per cent of the output.

Table III is a summary of the production, sale and value of all the important byproducts from coke-oven operations during the year 1921. The quantities of these byproducts were somewhat greater than reported probably from the quantity of coke reported to the Survey currently during 1921, and some of the gas used for heating the coke ovens must therefore a little below the final figures here given.

TABLE II—BYPRODUCT COKE INDUSTRY, BY STATES, IN 1921

State	Coal Charged Into By-product Ovens Net Tons	By-product Coke Produced Net Tons	Screenings Or Breeze Produced at Byproduct Ovens Net Tons	Total Sales of Byproduct Coke and Breeze Net Tons	Value
Alabama	3,476,923	2,401,127	155,568	363,705	$1,935,499
Colorado	417,112	286,755	23,492	18,137	155,071
Illinois	1,952,358	1,322,178	123,061	565,390	5,176,513

Value of all byproducts sold					$59,990,678

a Including gas wasted and gas used for heating retorts.
b Of this amount 75,760,334 gallons were refined on the premises to make the finished products listed.
c Includes quantity of crude light oil refined on premises.

Converting Half Time to Full Time by Coal Storage

Safe to Start Operation Without Even Promise of Cars—Steady Work Improves Morale and Makes It Easy to Get Best Men—Cost of Stocking Less Than Four Cents per Ton Mined

By W. R. Peck*
Coal Creek, Tenn

THE Black Diamond Collieries, of Coal Creek, Tenn., first started to store coal at their mines in 1918, during the war period. The plan used that year was not satisfactory, and in 1919 another plan was tried, a pit being used in which the coal was dumped and a derrick with a bucket to handle the coal from pit to storage. This method had such limited possibilities that it could be used only on those days when the mines were supplied with only a part of the cars needed—that is, if the mines had cars to run six hours, the storage would take care of the rest of the day or of the two hours at the end of the run. Due to the limited storage space afforded by the derrick, a locomotive crane was soon purchased, and in 1920 the yard was laid out as shown on page 917 and put into successful operation.

The equipment for the yard at present consists of a 35-ton locomotive, one 12-ton Industrial crane, one 20-ton Orton & Steinbrenner crane and four 24-yd. dump cars. These latter can be made to dump on either side, and are discharged into the pits. The coal is handled from these pits by cranes. The cranes are operated in many ways, as the yard is arranged so that both can work from either pit *A* or *B* at the same time, or so that one crane can work from one pit and the other crane from the other pit, or so that one crane will handle coal from the pit and the other crane will handle it to the back side of the storage yard. Each evening after the run is over, the cranes clean out the pits and, if necessary, work overtime by transferring coal so that there will be plenty of available storage space close to pits for the next day's work.

When the car supply is short, the railroad cars are used for the shipment of the larger sizes of coal and the steam sizes are sent to the storage yard. It has been found that the locomotive cranes will handle about a third more of the steam sizes than they will of run-of-mine coal in the course of a day, for with the former the buckets can pick up their maximum capacity, whereas in handling run-of-mine, lumps often get between the jaws of the bucket and cause the fine coal to spill. Another reason for storing steam coal is that when run-of-mine is stored, the handling of it more reduces it so that it can be sold only for boiler use, whereas the handling of the steam coal has little effect on its size.

Due to the lack of market, these mines operated only 35 days in the first ten months of 1921, but they resumed operations in November, 1921, on reduced wages and operated three to four days per week until May 1, 1922. From that date until the present time they have operated six days per week, with a car supply averaging for that period only 50 per cent; this six-day week's operation is due entirely to the storage pool.

Regardless of the many other evils that exist in the production of coal, the one great evil that always confronts the operator and the miner is that of "No railroad cars." The Fact-Finding Commission now in session should give careful consideration to the short-

*Engineer, Black Diamond Collieries.

SLOW REPORT BUT WORK WITH NOT A CAR IN SIGHT

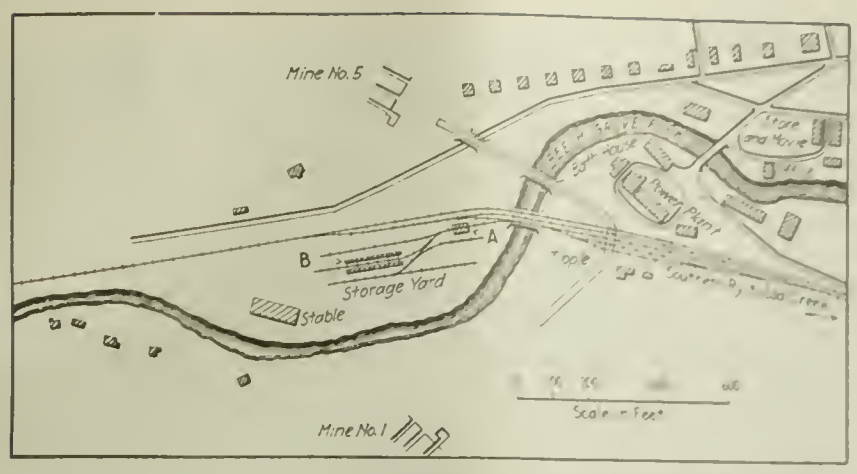
age of transportation equipment, its direct effect upon the price which the public has to pay for coal and the heavy losses that it causes the mine operator and the mine laborer. The recent coal and rail strikes have emphasized this fact.

On page 817 appears a chart prepared for the month of October, 1922, to show the effect on the mines of the short car supply and how by the aid of the storage yard they were able to operate six days per week with only 60 per cent of their full-car spots. In this, the Coal Creek field for some time past the railroad agent has been unable until the early morning to advise the mines how many, if any, cars they will receive for the day's loading. In many instances the agent has stated that no empty cars will be available, and in less than an hour's time has advised that the engine is on the road with several empties.

Where no storage yard is provided a report of "No cars" will cause the officials to keep the mines closed on that day, even though the railroad agent may be able to announce, after he has called the second time, that empties will be forthcoming. This is the one important advantage of a storage yard, for if you will refer to the chart you will see that out of the 26 work days in that month, on only nine days were there sufficient empties on hand before work time, 7 o'clock, to start the mines. On six of the other days the railroad was not able to place cars until after 11 o'clock. Do you think that the miner would have waited in his working place for the first empty mine car until 11 a.m. or that the shiftman would have remained at his post without pay to go to work at that time? But with the coal going to storage the mines were ready to commence to load railroad empties even when the railroad had to deliver the pieces of them until 2 p.m. In some instances the train crew that delivered the empties have taken away loaded as many as seven of those same cars. This was due to the fact that the miner was loading coal, that the shiftman was at his post and that the storage yard could at once change from the operation of receiving coal to that of loading it into railroad cars.

A storage yard of this kind at the mine is a benefit to the operator and miner. It is an assistance to the railroad company upon whose line it is located, and it is indirectly an aid to the public. Its advantage to the operator is self-evident, for by giving practically continuous operation it materially reduces his costs of operation, maintenance and overhead; it aids the miner by assuring him of regular employment, and these mines have found that this advantage to the mine worker is a benefit to the operator also in that steady employment attracts the best laborers—the men who want to work six days per week, and who save their money, the laboring men that can go to the pay window with a smile and be greeted with a smile, for most operators now realize that the man who draws good pay and saves it is by far the best workman. The storage is an aid to the railroad and to the public in that no matter how late empties are placed, they can be loaded out that day, thus giving a quick turnover of the empty cars.

In the month of October these two mines, for they are small operations compared with the big producing mines of the North, produced a total of 25,990 tons of coal; 21,258 tons was shipped, 7,836 tons was placed in storage, and 3,998 tons was loaded out of storage and shipped. In fact the 11,834 tons of coal was handled by one of the two cranes. This tonnage was handled at a cost of 0.063c. per ton, including the cost of operating and maintaining the locomotive, the "six spot," which of course paid its way in the handling of railroad cars alone, as you can see from the chart that it placed empties by going to the "Y" after them instead of waiting until the railroad crew finished other switching and was able to place them. The storage-yard cost on the whole mine tonnage was 0.037c. per ton.



The cost of the installation of this storage was, in round numbers, $10,000 for pits, railroad tracks and the experiment with the derrick. The pits are concrete, *A* being 44 ft. long, 22 ft. wide and 8 ft. deep, with a trestle so that railroad hopper-bottom cars may be dumped if necessary, whereas the two pits at *B*, one on each side of the track, are 120 ft. long, 10 to 12 ft. wide and on an average 4 ft. deep. Concrete retaining walls hold the track between these pits.

Fortunately this coal has so far shown no signs of heating. Thermometers are kept in the stockpile at all times and are read at regular intervals; the coal

WITH A PILE LIKE THIS ON HAND THE RAILROAD NEVER PLACES A SINGLE CAR IN VAIN

Any slack car which is not filled out under the tipple can have its quota completed at the slack pile and so can be billed out and if cars are put in so late that they cannot be loaded that day from the mine, the slack pile is handy and the railroad may be sure of its quota.

PLAN OF VILLAGE, OPENINGS AND TIPPLE YARD

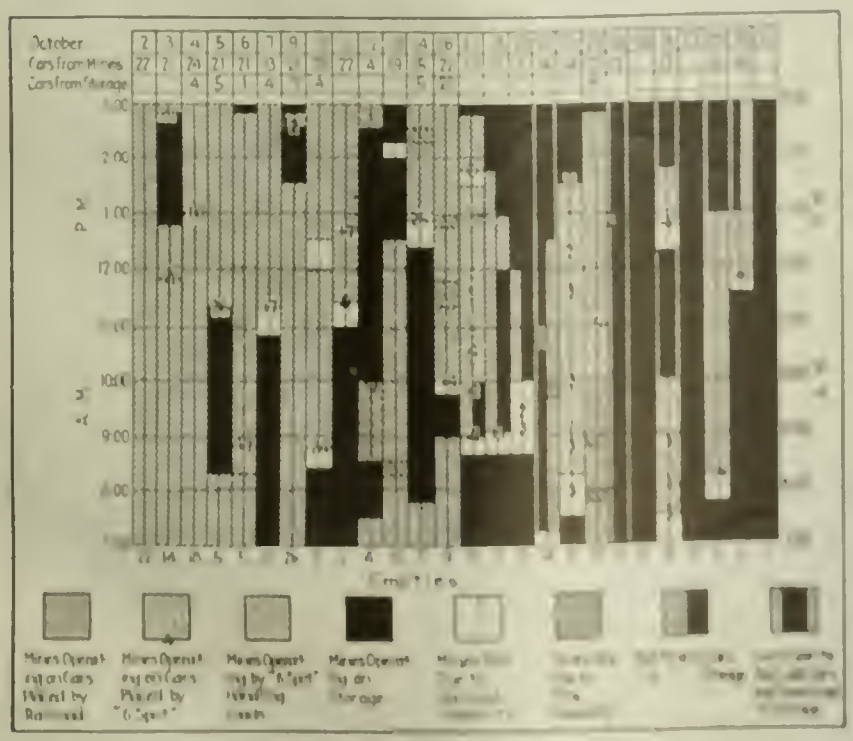
A and *B* are the pits into which the coal is dumped for transference to the storage piles. Pit *A* measures 22 x 44 ft. in horizontal dimensions and is 8 ft. deep. The pits marked *B* are on either side of the track and measure in plan 10 or 12 ft. by 120 ft.

is piled to a maximum depth of 30 ft., and the highest temperature so far recorded has been 96 deg. F. On Oct. 31 27,000 tons of coal was in stock, with room for approximately 13,000 more tons, for the yard has a maximum capacity of 40,000 tons.

Relies on Experience, Despite Car Shortage

Some may wonder how this company expects to dispose of this storage coal without loss with the present railroad car supply, which, in fact, seems to be getting worse instead of better. This company is relying on its past experience, for on Dec. 1, 1920, this yard had 13,000 tons of coal, and on Dec. 24 it was bare, ready for the shutdown of Jan. 1, 1921. This coal was moved at a good profit. What has happened in the past is quite likely to occur again. In this connection it may be said that for accounting purposes this coal is credited to the mines as if it was sold at the cost of production and storage, and when moved a loading charge is deducted from the selling price.

Of course all mines do not have ground available that can be used for the storing of coal, but where it is possible to put in a storage yard with equipment that can handle the mine or mines at their full capacity for a day's running time, it is a paying investment, even if the coal is finally moved only at cost. The profit is in steady operation, in a better class of mine labor, in better satisfied men and in a good organization that will hold together for the better times ahead.



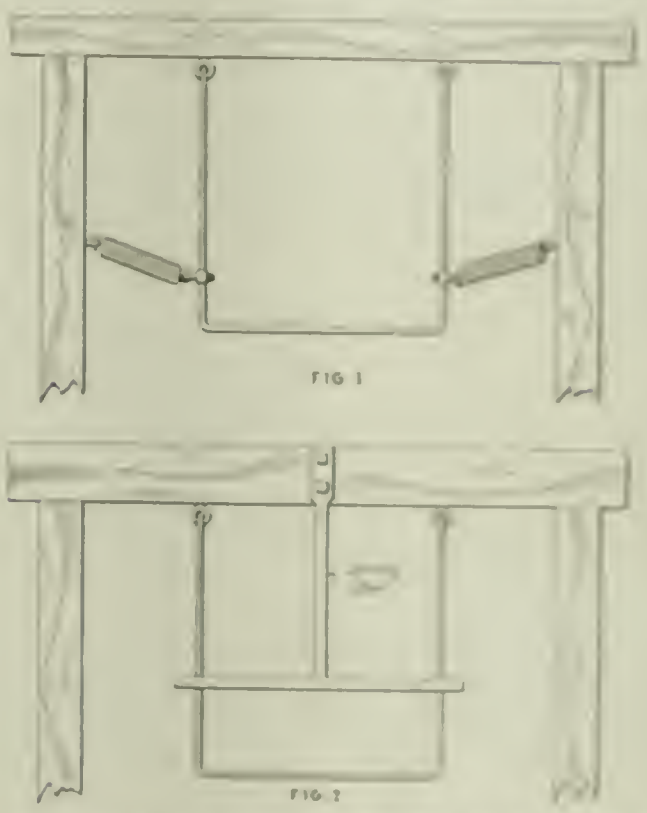


CHART OF OPERATION FOR OCTOBER, 1922

"Six-spot" is the locomotive of the coal company which assisted in keeping the mine in operation. It will be noted that only on nine days in the month were sufficient cars on hand to start the mines.

Springs Steady Gate Hooks of Horn Dump

By Cecil Rowe
Tokay, N. B.

Sometimes when using horn dumps the lugs of the endgate of the car fail to engage in the stirrup, or lifting hook, allowing the car to tip over without the endgate being opened. When the cars used are large and the material to be dumped is heavy, the contents come against the door with much force and several men are required to pry it open. In consequence much time is lost at the tipple. To overcome this difficulty two devices have been used. In *Fig. 1* the pawl to engage with the end lugs of the door was held from swinging by placing a helical spring on either side as indicated. In Fig. 2, which was for a different style of car, the stirrup was held in place by a piece of spring steel securely fastened to the top timber by bolts.

GATE HOOKS THAT DON'T SWING OUT OF PLACE

The upper gate hook has a longer term of service than that below, the long steel spring soon losing its resiliency

The device shown in Fig. 1 was found to be much more satisfactory than that shown in Fig. 2, for the helical springs stood the shock of dumping much better and for a long time continued to return the stirrup to its normal position. The spring steel shown in Fig. 2, soon became distorted, making a frequent change of that part necessary.

*Mining engineer, E. H. Rowe and Son.

Legislation Embodying the Administration's plan for the reorganization of the government's executive machinery probably will be introduced during the December session of Congress. If the draft of the bill cannot be perfected in time to insure action during a session which necessarily must be devoted largely to appropriation bills, it will be taken up at an extra session which it is believed will be called next spring. It is understood that the administration bill will not provide for a Department of Public Works. There will be a grouping, however, of public works activities under an assistant secretary.

How to Make Stubborn Pumps Pick Up Water

By James Wall, Sr.

IN MANY mining districts of the United States are small and comparatively wet mines that cannot or think it unnecessary to afford a complete mechanical department. In these the pump tender is held more or less responsible for the successful operation of the pump or pumps under his charge.

Nothing perhaps causes as much annoyance in the operation of gathering pumps as a failure to advance them as the workings extend. In consequence the tail pipes soon become excessively long. Furthermore, in pumping from working places no foot valve is used, because it is necessary to run the pump on air for some time in order to insure that the plant be thoroughly dried. A stop valve is used, however, in each suction line.

In order to operate gathering pumps successfully under the condition mentioned and yet run the pump until the limit of suction is reached, no better method probably can be devised than to connect the water cylinder and tail pipes with the permanent spraying system by small pipes having stop valves. The pump and tail pipes usually can then be primed at any time, and to insure that the pump will not "lose its water," also to prevent injury to the packing in case the pump is allowed to run on air for a long time, a stream of water can be allowed to enter the pump continually from the spray line or the discharge line, and the suction line can be connected by a small bypass with a stop valve.

But it sometimes happens that no provision is made for priming the pump and keeping it primed, and the pumper is then put to his wits' end to get the pump to "pick up its water." If the pump valves and packing are in doubtful condition they should be tended. They may need scraping and greasing or turning over. This attention may help much to make them seat properly.

Use Short Siphon for Priming Pump

When it is known that the pump is in good condition and that the only disadvantage under which it is laboring is the length of suction line, the latter may sometimes be nearly filled by siphoning from a suction nozzle near the pump. The pump draws water through this nozzle and is stopped as soon as the tail pipes are filled almost to the level of the water supplying this nozzle.

Another way of helping the pump to get into effective action consists in allowing the nozzle of a suction line, where it is long, to get water and air alternately at short intervals until the pump "catches" and "holds" the water. The principle used probably is that of the air lift; the atmospheric pressure is able to support a higher column made up of air and water than if only water were allowed to enter the suction column. The nozzle should be so arranged that it can always be lifted above the water; large nozzles attached to rigid pipes should have a chain attached; the latter should be carried over a pulley and a swivel joint used in the pipe line so that the nozzle can be lifted for inspection or as necessary.

The pump works on the principle that the difference of pressure between that end of the water cylinder that is connected with the suction and the outside atmosphere, forces water through the suction line and into the pump. In common pumping practice this pressure is applied gradually as the water cylinder, valve chambers and suction pipes become depleted of air by exhaustion; but by *suddenly* applying this difference of pressure, wonderful results are obtained in overcoming the obstinacy of pumps to the "picking up of water."

Some station pumps that are provided with large sumps are shut down during week-ends and if the pumper is not careful to make the last run on clear water and shut down before the pump gets on air, he is likely to have much trouble on Monday morning.

I remember being called to assist in priming a large triplex plunger pump that had been closed down during a weekend and had lost all water both in the suction line and the discharge column; the valves were dried out and warped, and a crew of men had to carry water from the sump 100 ft. distant for two hours before this pump could be made to do its duty, although it had only 100 ft. of tail pipe and a 4-ft. lift.

Some of the mine officials were much concerned, as this trouble seemed likely to occur weekly. The assistant superintendent accidentally hit on the plan of applying the atmospheric pressure suddenly, as just stated, and the results have been most gratifying. I have tried the kink myself on many occasions. Even when the pump had been operated by ordinary methods without success until the water cylinders became warm and so long that any mechanic would have pronounced the attempt hopeless, this method never failed provided the pump valves and packing were in good order.

The method, which is as follows, requires a valve in the suction line close to the pump: Start the pump with the valve on the suction line open. Allow the pump to run until little air is being discharged from the waste or starting pipes. Then close the valve on the suction line and allow the pump to run from 5 to 10 minutes longer. That period over, open the valve on the suction line very quickly, then watch the water come. I tried this method also on a large 10x18-in. triplex plunger pump with 400 ft. of tail pipe, an 11-ft. lift and no priming water. The pump had a reputation for obstinacy but it was pumping water 15 minutes after starting and the pump mentioned earlier as causing so much trouble can at any time after a weekend shutdown be made to operate successfully without priming in from 15 to 20 minutes.

IN THE GENERAL STUDY of the heat of distillation of coal, being conducted at the Pittsburgh (Pa.) Experiment Station of the U. S. Bureau of Mines, the problem of the effect of the inert atmosphere in which the distillations are conducted has been studied. In a series of special tests, atmospheres other than nitrogen and hydrogen were tested. Illinois coal which gave 60 c.c. of gas and an exothermic reaction of 22.5 cal. at 600 deg., in nitrogen, gave, in hydrogen, an endothermic reaction of 12 cal. with gas absorption amounting to 60 c.c. All other coals of the series gave gas evolution in nitrogen and gas absorption in hydrogen. This means that the net reaction heat during distillation is dependent on the partial pressure of hydrogen in the reaction products. This heat effect with hydrogen is regarded as the most important development of the whole research.

IN THE COURSE OF TESTS made at Pittsburgh, Pa., by the U. S. Bureau of Mines, lignite char has been found to burn to a gas containing a higher proportion of carbon-monoxide than that from coke. To determine if this relatively high carbon-monoxide content with lignite char is to be attributed to the smaller size of the char, coke of the same size as the char will be burned on the next tests.

Safety Precautions at Dolomite Prevented Explosion From Killing All the Men in That Mine

Blast Took Place in Intake Airway and Burned Tipple Roof a Long Way from Mine, Yet Spread Over Only a Limited Area of the Workings, Thanks to Safety Provisions

BY H. S. GEISMER*
Birmingham, Ala.

A LOCAL dust explosion caused by three cars running wild down an 880-ft. 30-deg. slope resulted in the death of ninety persons and the injury of fifty-five more at Dolomite No. 3 mine of the Woodward Iron Co., near Birmingham, Ala., Nov. 22, 1922. The coal seam which the mine develops is flat but it is approached by a steep slope which serves as an air intake and double-track haulageway to the outside. The trip of cars broke loose at the tipple—a revolving dump handling the cars without uncoupling—and ran back into the mine the full 880 ft. without jumping the track. The gathering sidetrack is about 500 ft. from the foot of the slope. One of the cars ran into the loaded cars standing at this sidetrack, the rest of the cars being scattered along the empty track and badly shattered in consequence.

The explosion occurred almost at the foot of the slope and must have been caused by a cloud of dust stirred up by the runaway cars. The dust was ignited either by a flash caused by the cars coming in contact with a 3,300-volt feeder cable suspended along the side of the slope or else by a flame from the 250-volt trolley wire that the wrecked cars pulled down from its supports. At times the mine generates a little gas in its advanced workings but none could have been present at the point of the explosion, as it is directly in the intake current, where 60,000 cu.ft. of fresh air enters the mine. The explosion traveled back up the slope, coming out of the mine mouth and setting fire to the timber work on top of the tipple. It also traveled into the mine along the main haulageway a distance not to exceed 1,000 ft. To the right of the main haulageway a few brattices were destroyed and to the left of that roadway the explosive force traveled several hundred feet.

The lead-covered feeder cable from the outside is carried down along the side of the slope to a substation a few hundred feet inside of the foot of the slope. Most of the machinery in this substation was damaged by the explosion and the mine fan at No. 2 airshaft, which ventilates this mine, was shut down when the current went off. This fan is equipped with an auxiliary gasoline engine and within three minutes after the explosion the fan resumed operation, and ventilation throughout the mine was immediately established except in a restricted area where the brattices were destroyed.

The explosion occurred about 3 p.m. and by midnight all the bodies had been recovered and the mine was in practically normal condition.

Of the ninety killed, probably about two-thirds met death instantly, the others being killed by afterdamp. Every inside foreman, including the master mechanic, the motor inspector and the section foreman, lost his life. Four hundred and seventy-five men were in the mine at the time of the explosion and the loss of life from afterdamp would undoubtedly have been much higher but for the number of exits that the mine contains.

The seam was originally opened forty-two years ago with No. 1 slope; this was later followed with No. 2 slope and the workings were connected. Later No. 2 airshaft was sunk to reduce the air travel, and this was followed a few years ago with No. 3 rock slope, where the explosion occurred. The connected workings extend several miles along the outcrop of the seam and have penetrated about four miles at right angles to the outcrop.

In all the forty-two years of operation no explosions have occurred. Open lights are used by the miners and electric haulage equipment and mining machines are installed throughout. Gas occasionally is encountered

*Kelser-Geismer Engineering Co.

Tipple After Explosion

Flame from the mine burned down the roof of the tipple and the water tank. Nothing was more remarkable in this explosion than the way the lambent flames from the slope traveled up the surface incline, licking up everything inflammable in their path

FOUR-IN-TRACK ROCK SLOPE INTO MINE

A coal mine has heavy 24-lb. rails that the locomotive cars support, using open wires, the short-circuit from which were no live at under the load caused by the rapid movement of the cars.

in some of the advanced workings but never in troublesome quantities.

The coal mined is of the Pratt Seam and has the following analysis: Fixed carbon, 60 per cent; volatile matter, 30 per cent, and ash, 6 per cent.

That four cars traveling approximately 1,000 ft. down a 7x15-ft. slope cut through solid rock could raise enough dust to cause such an explosion is almost inconceivable, but that apparently is what happened. The Woodward Iron Co. had gone to much expense to make the mine safe. It has a special safety department to report on the condition of its haulageways.

The state mine inspectors have always reported favorably on this mine. Thus in the 1920 report E. E. Echols, the inspector of the First District, says: "Dolomite No. 3 . . . is ventilated by a large Capell fan at the airshaft about two miles from the mouth of the mine. This fan is the same as that mentioned in describing No. 1. It is electrically driven. This mine has another large Capell fan, gas-driven, stationed there for an emergency. Furthermore, a steam-driven 6-ft. Sirocco fan has been installed at the mouth of the mine for emergency use. . . . The mine is kept wet with sprays and hose. Much work has been done in this mine during the past year to improve ventilation. New and larger pipe lines have been laid for sprinkling purposes."

The report also says: "The mine has good tracks and they are kept clear." Dumped as they are on a rotary dump, the cars do not require doors and so do not spread coal along the tracks. Furthermore, there are no large cracks in them through which coal can leak to be scattered along the haulageway.

Dolomite mines are within four miles of Ensley and Bessemer and not more than twelve miles from Birmingham, which accounts for the large crowds that were on hand within a few hours after the explosion. Before nightfall all the roads leading to the mines were blocked with automobiles, and a company of the Alabama National Guard, assisted by deputy sheriffs, was needed to hold back the sightseers and the anxious friends of those inside. All the officials of the Woodward Iron Co., from President Frank H. Crockard down, were on hand and remained until every man in the mine had been accounted for. They were tendered the assistance of more trained rescue men than they could use. This is the first large explosion that has occurred since the Alabama Workmen's Compensation Act of 1919 went into effect.

ANOTHER VIEW OF THE DOLOMITE TUNNEL

This mine runs nearly on the dip, but rails of which the rest is flattened somewhat approaching the mine entrance. The cars at the mine mouth are dumped and by gravity roll down the slope, where they are regularly hauled to the surface, and then returned.

Large Trolley Wheel for Heavy Current

RECENT tendencies in mine-haulage practice are toward the use of larger and larger locomotives which can handle correspondingly heavy trips. This, of course, means heavier currents to be collected from the trolley line, and to meet this conditon the Ohio Brass Co., of Mansfield, Ohio, has brought out a 6-inch trolley wheel and a 6-inch harp.

SELF-ALIGNING TROLLEY HARP FOR BIG LOCOMOTIVES

Graphite bushing with grease-filled reservoir makes the trolley wheel revolve readily. Current is collected through phosphor-bronze contact springs.

The wheel is made of bronze and has a graphite bushing. Around the bushing is a reservoir filled with grease at the factory. The harp collects the current from the wheel through phosphor-bronze contact springs. The pivot is set forward of the axle so that the harp trails freely.

A self-aligning harp made in both the 4- and 6-inch sizes has also been developed and placed on the market. A spring brings the fork casting into line with the pole head when the wheel is not on the wire. This simplifies the task of replacing the wheel in case of dewirements and also enables the harp to operate especially well through frogs and crossings which are in many instances the cause of much annoyance to the motorman.

Problems of Operating Men

Humidifying Air Currents in Mines in Utah

The Utah Mining Law and State Industrial Commission —Efforts to Reduce Danger of Mine Disasters— Requirements of the State Mining Law in Regard to Dust

IN conversation with a friend, a short time since, mention was made of the progressive character of the mining law of Utah. The law was described as being particularly enlightening and containing stringent measures designed to make mine disasters less frequent, if not impossible. In that connection, allusion was made to the efforts of the State Industrial Commission.

A little later, being interested in the subject of humidifying mine air, as recently discussed in *Coal Age*, I looked up the Utah regulations pertaining to the wetting of mines in that state. In the revised statute of 1898, I found (Sec. 1516) the following reference to the question of watering:

> Water system: Every owner, agent, manager or lessee of mines within the State of Utah, shall provide and maintain a water system for the purpose of conducting water to the face of each and every working place and throughout the entire open part of the mine, in sufficient quantities for sprinkling purposes to wet down the dust that shall arise and accumulate in and around the mine: provided that in mines or parts of mines where, by reason of the natural wet condition or the moisture derived from the introduction of steam into the air current or both, such sprinkling may not be necessary. And it shall be the duty of the superintendent, mine foreman and inspector to see to it that this is done.

In addition to this, I found that the Industrial Commission had issued certain "safety orders." After drawing attention to the requirements of the state law contained in the section just given, the circular of the commission continues as follows:

> It is further ordered that when and if requested by the mine operator, mine superintendent or foreman, or when conditions warrant, by the Industrial Commission, the water system shall be so arranged and a hose of sufficient length provided, for each working place or pair of working places so that the miners can keep their own working places wet for a distance of at least 50 ft. back from the face. Also, such hose shall be provided by the operators for each and every miner who may make request therefor.
>
> It is further stated that, "when the miner has requested the hose, it is his duty to keep his place wet." Further, "anyone who, without authority, removes or willfully damages any part of a sprinkling system, violates the law creating the Industrial commission."

Not long ago, in an address describing the mining of coal in Utah, Chief Engineer, A. C. Watts, of the Utah Fuel Co., spoke as follows:

"Not the least among mine-safety precautions are the electric shotfiring systems, used in many of our mines, and the sprinkling system. Both of these systems were used by the Utah Fuel Co., as far back as 1889, or 1890, in its Castle Gate mine. At that time, the officials of the company became convinced that coal dust would explode without the presence of gas. In order to eliminate the frequency of local dust explosions, the management caused all shots to be fired from the outside, by electricity.

Installation of Water System and Sprinklers for Wetting Dust

"As a further precaution, a complete water system was installed in the mine and sprinklers were employed to thoroughly wet down the dust. The intake air was also humidified by means of an atomizer, using steam to atomize the water. Later, a state law was enacted making sprinkling compulsory in all mines not naturally wet. In complying with this law, the common practice is to use hose, short lengths of which are attached to the pipe system or other source of supply.

"It is the custom in all our mines to flatten the end of the hose with a stiff wire, so that the water issues in a thin wide spray. In this manner, the sides, roof and floor of all roads and passageways are thoroughly wet down and kept wet. Our company has adopted the plan of running the water pipes up each room and supplying the miners with hose, 20 or 25 ft. long, which are kept attached to the ends of the pipe line. Each miner is required to keep the cuttings and dust in his place thoroughly wet.

Watermen Employed to Sprinkle All Working Places

"In one of our mines, the men are required to sprinkle every two hours. The machine cuttings are carefully piled up, wet down and loaded out in special cars. When these cuttings do not make a full car, mine-run coal is added to top off. The sprinkling of the rooms is not left entirely in the hands of the miners, but regular sprinklers or watermen are employed to wet down the rooms, also. It is customary to wet the cuttings of mining machines while the latter are in operation.

"Only the other day, I was asked how much water was needed to make the mine safe? Now, I will not claim that this wetting can make a mine absolutely 'safe'; for that word must be used conditionally. However, after some figuring, I estimated that we require one gallon of water to every 21 sq. ft. of surface, three times a week, in order to keep the dust in a wet condition.

"We consider that the dust is wet down when it will ball up, on being squeezed moderately in the hand, and will show the imprint of the fingers. Some of the mines make enough water, in certain sections, to sprinkle other sections that are dry; and the necessary connections are then made to utilize the inside pumps. In all cases, however, connections are maintained with the outside pumps, so that, in case of fire, it will not be necessary to depend wholly on an inside pump, which might not be available at the time. Many mines turn exhaust or live steam into the intake during the night."

It has occurred to me that these remarks and references to humidification in the mines of Utah would be of interest to *Coal Age* readers, in connection with the discussion to which I have referred.

Underground Official Positions

Responsibilities of mine superintendents and foremen—Dangers to which firebosses are daily exposed make them among the most important

WHEN writing on the subject of "Where Coal Mining Practice Could Be Materially Improved," William Allan has drawn attention to several points where improvement is possible, both in practice and equipment.

At the close of his article, Mr. Allan has incidentally called attention to a question that must interest all firebosses. The question is suggested by the offering of a prize, by a large coal mining company in England, for the best answer to the question, "What is the most important job on the colliery?"

Now, every mine official has his own particular part to play and his own work to perform to insure the safe and economical operation of the mine, which will make the undertaking profitable to the owner. It is very possible that each of the officials of a large company may consider his job of the most importance.

With regard to the underground officials, including the mine superintendent, foremen and firebosses, it must be acknowledged that the superintendent is the responsible head, who must account to the owner or operator for every transaction in the mine.

Self Interest Is Chief Bar to Active Co-operation

Gaining co-operation of employees—Self interest the dominant factor—Duties optional in proportion as this principle is recognized.

MANY suggestions have been made, from time to time, by writers in *Coal Age*, in regard to different methods of securing the co-operation of employees, in efforts to make the business more profitable. It has been urged that much mutual benefit can be derived by mine officials meeting their men regularly for the purpose of discussing subjects pertaining to their work.

The aim in such meetings would be to establish familiar social relations between the officers and men. Most thinking men recognize that many suggestions of practical utility and value can be obtained through an open discussion of the problems that daily arise in their mines. It is generally admitted that this social intercourse will produce kindly feelings and result in the active co-operation of every worker.

Enlisting Men's Interest

In order to succeed along these lines, however, the first essential is to enlist the interest of the men. An interest once aroused goes a long way toward securing their hearty co-operation in the performance of each one's part in the work. Otherwise, efforts in this direction will fail, as has been proved time and again in similar undertakings.

It will be generally admitted that the interest of any class of industrial workers depends primarily on the amount of remuneration received for the work performed. On the other hand, the chief interest of the employer lies in the profits derived from the business. In each case, it is evident that individual, selfish interest is the dominant factor, and forms the basis for the antagonism that so largely prevails between employers and their employees.

Now, the common acceptation of any industrial enterprise is that it is the indisputable property of those who have invested their money in the undertaking. The paid employee, whether working on a wage or salary basis, is considered merely as an auxiliary factor whose interest begins and ends with the remuneration he receives for his services.

Wages and Profits of Business Diametrically Opposed

But, without calling into question the truth of this acceptation, it is quite evident that such a doctrine absolutely debars the worker from manifesting the same interest in the economic welfare of the industry as those having a definite monetary interest, the two factors being diametrically opposed, makes a clash on this basis almost inevitable.

A broader acceptation of industrial economics, however, has demonstrated that greater material benefit results, both to the industry and the community it serves, when the conservation of the energy of the worker is desired. This knowledge has given rise to much judicious welfare work on the part of large employers of labor.

Nevertheless, however beneficient these efforts may be, they fall far short of engendering any permanent personal interest in the daily operation in which one is employed as a factor. Too often, the welfare work of large companies is regarded, by their men, as a matter of policy rather than one of principle, and a harmful suspicion lurks in the mind and renders these efforts abortive.

Old Relations Giving Place to New Assures Industrial Peace

The present industrial crisis demonstrates clearly that the old principles of relationship of employer to employee must give place to one of mutual dependence, before any permanent industrial peace can be assured. The assumed independence of capital and dependence of labor is not in keeping with the principle of equal rights, which is the foundation of our government.

Briefly stated, success in industry depends on the hearty co-operation of every factor in the undertaking; and such co-operation cannot be secured without a mutual recognition of the individual rights of both parties. In its application to industry, this means that the financial success of an enterprise involves the financial betterment of every factor in the undertaking.

So deeply does the element of self interest enter every undertaking, that the problem of securing industrial peace must be approached at this point. Only in proportion as this principle is recognized will success crown our efforts to promote harmony and bring about peace and prosperity in business.

Every Worker Should Feel Himself Part of the Business

Every wage earner must certainly be aware of the fact that if the business in which he is employed is a financial success, he is assured steady employment. This knowledge should be a sufficient incentive to him to insure his hearty co-operation and efforts to make the undertaking profitable. It should make every worker feel and act as though the business was his own.

Much has been said about the application of the Golden Rule in business. I regret to say that, in the present and past history of industrial relations, the Golden Rule is recognized more in the breach than in its observance. Unfortunately, for industrial peace and prosperity, the moral sentiment of mankind is yet in its infancy.

Speaking of practical suggestions for improvement as coming from the men, it is well known that these suggestions are not always received in the spirit in which they are given. Many practical and industrial workers are reluctant to suggest a new plan or method of performing their work, fearing that this would be regarded as reflecting on the present management.

Too often, it must be acknowledged, that men who have expressed their honest and practical opinion, in all sincerity and good faith, have found themselves marked down by some one higher in office, who may fear their ascendancy in the scale of promotion.

On this account, it is not strange that many workers regard well meaning efforts on the part of the management as schemes to trap the credulous. The credulous are invariably a class comprising the most honest and industrious workers who have the best interest of the operation at heart and who would, if given opportunity, prove themselves progressive factors.

Washington, D. C.

America a Modern Utopia

The ideal in life the beacon light ahead—Ideals spur to action by which worth-while deeds are accomplished.

PRIMARILY, Bolshevism was reared in Russia, under the crude teaching of Lenine & Trotsky, and the transition that has taken place from the first upheaval till now is nothing short of remarkable. Shackled with corruption, oppression and brutality, the people, ground between the upper and nether millstone of monarchical austerity and political greed, groped for light in an effort to work out their own salvation.

The struggle has been that of a downtrodden people who had to grapple with a brutal and hostile world—hostile at least to their ideals—with which, at no far distant day, I believe the world must conjure.

It was not Lenine or Trotsky that caused this enormous upheaval. It was the ideal that shone as a beacon light at the end of the struggle. Washington and Lincoln, today, are not revered so much for what they did as for the ideals for which they strove. Every worth-while accomplishment is only made possible by the ideal that shines as a beacon ahead.

IDEALS THAT HAVE NEVER BEEN REALIZED IN ANY LAND

From the latter end of the fifteenth century when Sir Thomas More wrote his "Utopia," philosophers down through the ages have conceived ideals for which, like Sir Thomas, they have suffered martyrdom. But, the world is better today for those ideals.

Sir Thomas More's "Utopia" (Good Faith) describes an imaginary commonwealth that inhabited an island. The people lived in peace and harmony through the practice of their ideals. It was accounted piety to prefer the public good to one's private interest. To seek one's own welfare at the expense of another was unjust and a crime.

Can we hope that this picture of tranquil life is a foretaste of the future of this country? It must be admitted that our economic condition, at present, is not a happy one. It is rather a reflection on our boasted enlightenment. Hoarded wealth and absolute penury are next-door neighbors. On every hand, affluence and plenty are in sharp contrast with everlasting grind and want.

Reflecting on this present state of affairs we are led to ask ourselves, is this in keeping with our boasted ideals that "All men are created free and equal?" Communism, in the generally accepted meaning of the term, may be all wrong; but the ideal of human brotherhood and equal rights can never go wrong. Such ideals train men's minds to a higher plane of living and open to our view vistas of America as a modern Utopia.

While there are dishonest men in all phases of industrial activity, the vast majority of our fellows are honest and painstaking, while groping for the light of progress in their efforts to

"Make trade a Christian possibility,
And individual right no general wrong."

Inquiries Of General Interest

Developing a Steeply Inclined Seam of Coal

Main slope driven three or four abreast, on the full dip of the seam—Gangways or levels turned right and left on the strike.

HAVING in hand the development of a steeply inclined seam of coal, varying in thickness from 8 to 10 ft., roof to floor, I am desirous of ascertaining the best plan to adopt, looking to the economical extraction of the coal and operation of the mine.

The inclination of the seam varies from 42 to 45 deg. from the horizontal. The topography of the ground is such that I could drive a 20-deg. slope, on the strike or end of the coal, and proceed with the development in that way, although the plan does not appeal to me as the best one to adopt when taking all into consideration. I want to ask, would it not be more economical to drive a double-compartment incline on the full dip of the seam and use cages or skips having a capacity of, say, two cars of coal? I should be pleased to have the friendly suggestion of *Coal Age* and its practical readers in regard to this problem.

R. E. RUSSELL.

Evanston, Wyo.

The meaning of this correspondent is not clear in respect to the proposition of driving what he terms a "20-deg. slope on the strike or end of the coal." This statement would seem to suggest that the seam outcrops or reaches the surface along a line having an inclination of about 20 deg.; and it is proposed to drive the main slope heading at some distance inside and parallel to this cropping.

Such an interpretation assumes that the term "strike" and the expression "end of the coal" are used by the correspondent in a general way. The strike of a seam being level, it would not be possible to drive a 20-deg. slope on the strike. Again, the expression "end of the coal" is generally used in reference to the butts or rise cleats of the coal.

The proposed driving of a 20-deg. slope, in the manner suggested, does not appeal to us as a practical proposition in the working of this seam. In general, the main heading, in the development of a highly inclined seam, should be a slope driven on the full dip of the seam. In a large development the main slope headings should be driven three or four abreast so as to provide separate return air-courses for each respective side of the mine, the center headings being made the main haulage road and intake.

To the right and left of these main slope headings, gangway levels are driven at such distances apart as will provide a suitable length for the chutes driven up the pitch from the gangways. The gangway levels are driven in pairs, one entry being the haulage road and the other the air-course and drainage level.

At the mouth of each level there must be arranged a landing where the cars can be run on to the platform of an incline cage operating in the main slope. The cage can be arranged to hold two cars at a time if desired. Some prefer self-dumping skips into which the cars are dumped at each landing and are not taken out of the mine. This, however, necessitates handling the coal twice and is not recommended if the coal is soft and easily broken.

Cost of Sinking Slope

Length of slope computed from the vertical fall on a given inclination—Calculating the amount of material excavated.

I HAVE been asked to compute the cost of sinking a slope 8 x 10 ft. in section. The slope is driven on a 25 per cent grade and has a total fall of 40 ft.; but the length of the slope is not given. Kindly explain how the cost of sinking this slope can be calculated.

the price being $1.40 per [illegible] of material excavated. [illegible]

Ruby, Ind.

The first step is to calculate the length of the slope, for the given fall and horizontal. Estimating from the horizontal, a 25 per cent grade means a rise of 25 ft. per 100 ft. of horizontal distance. To that case a fall of 40 ft. corresponds to a horizontal distance of 160 − 100) = 25 = 160 ft. The corresponding length of the slope is, (hypotenuse = $\sqrt{40^2 + 160^2}$ = 165 ft.

The sectional area of this slope is 5 × 16 = 80 sq.ft. The amount of material excavated is, therefore, (165 × 80) ÷ 27 = 488.9 cu.yd.

Finally, at a price of $1.40 per cu.yd., the total cost of the excavation is 1.40 × 488.9 = $684.44.

Examination Questions Answered

West Virginia Mine Foremen's and Firebosses' Examination, Charleston, 1922

(*Selected Questions*)

QUESTION—*Before giving employment to any person, what information would you require from said person seeking employment in your company?*

ANSWER—The man should state where he had been formerly employed and his reason for making a change. He should be able to give satisfactory references in regard to his character and ability as a miner. He should state his experience in coal mining and in what capacities and how long he had been employed. He should show that he has a knowledge of the mining laws of the state; that he can read and write English and is willing to be governed by the rules and regulations of the mine.

QUESTION—(a) *Explain some source where capital is tied up unnecessarily. (b) State how you would propose to lessen it in amount.*

ANSWER—(a) Capital invested in a mining proposition is unnecessarily tied up when the equipment secured is more than needed, or of a kind that is not adapted to the purpose in hand. This applies to all kinds of tools, machinery and supplies. Sometimes capital is tied up in the acquisition of land and other property that cannot be utilized for a long time to come.

(b) The mine foreman should not order supplies and equipment that he cannot put into immediate use. He should endeavor to dispose of such discarded equipment as may be salable and use what is serviceable where it will eventually be thrown on the scrap pile.

QUESTION—*What instructions would you give to all employees and what precautions would you take to guard against loss of life and damage to property, by reason of what fires in and about the mines?*

ANSWER—All employees should be made thoroughly acquainted with the mine rules and regulations, which must be strictly enforced. Any violations of the rules should be instantly punished. The proper precaution to be taken in respect to danger to life and property by reason of fire in or about the mine should be such as to afford reasonable protection against fire. These rules should relate to the use of open lights; the handling and storing of combustibles and explosives; and the amount of explosives that may be taken into the mine by each miner. There should be provided an efficient water supply and apparatus and appliances for fighting fires, both on the surface and in the mine. A sufficient number of reliable men should be drilled in the use of the apparatus and understand their duties if an alarm of fire is sounded. At such times, it would be the first duty of the mine foreman and his assistant to notify and withdraw all the men from the mine.

QUESTION—*Describe what system of ventilation and general supervision you would adopt in order to keep your mine in a safe condition.*

ANSWER—All ventilating apparatus must be kept in good condition and be capable of supplying the required amount of air in the mine. On entering the mine, the air current should be divided into two or more splits and distributed so as to give to each district or section of the mine a volume of air sufficient for its needs. Each air split should be made to sweep the working faces in such volume and velocity as to dilute, render harmless and carry away the gases that would otherwise accumulate in those places. Wherever necessary, brattices must be erected to conduct the air to the working face. All stoppings, doors and air bridges must be made tight to prevent the leakage of air through them.

QUESTION—*State in detail how you would conserve materials and supplies in and about a coal mine.*

ANSWER—In the first place, all supplies and material of every nature should be properly stored and accounted for. Each should be in charge of a reliable person and no material or supplies should be given out to men, except on the order of the mine foreman or an authorized assistant. All material and supplies should be inventoried as received and an account of stock should be taken each year to check the amount on hand. Again, the mine foreman and his assistant should see to it that no rails, track ties, timber and other material are thrown aside and left to be covered up in the waste. All such material should be gathered up and properly stored when not required for immediate use. When places are to be abandoned, the foreman and his assistant should see that all tracking and available timber are removed and sent to places where they can be used to advantage.

QUESTION—(a) *In an airway 14 × 6 ft., there is passing 63,000 cu.ft. of air per minute; what is the velocity of the air current per second?* (b) *This airway is 6,500 ft. long; what is the rubbing surface?*

ANSWER—(a) The sectional area of this airway is 6 × 14 = 84 sq.ft. The quantity of air passing is, therefore, 63,000 ÷ 60 = 1,050 cu.ft. per sec.; and the velocity of the current is 1,050 ÷ 84 = 12½ ft. per sec.

(b) The perimeter of this airway is 2(6 + 14) = 40 ft.; and the rubbing surface is, therefore, 40 × 6,500 = 260,000 sq.ft.

QUESTION—*What is the weight, in tons, of the air constituting the ventilating currents in a mine when their combined volumes are equal to 2,240,000 cu.ft., assuming the temperature inside to be 62 deg. F.?*

ANSWER—The weight of a cubic foot of air, at this temperature and a barometric pressure of, say 30 in. is

$$w = \frac{1.3273 \times 30}{460 + 62} = 0.07628 \text{ lb.}$$

The total weight of air in the mine is, therefore, (2,240,000 × 0.07628) ÷ 2,000 = 85.43+ tons.

QUESTION—*If the volume of air proves insufficient when the fan is running at its full capacity, what would you do, under such circumstances, to improve the ventilation?*

ANSWER—First, clean up the airways, enlarge breakthroughs, straighten the air-courses, shorten the distance of air travel wherever practicable and repair all leaky doors and stoppings. When this is done, examine carefully to see if the air current cannot be split, at certain points, whereby the ventilation will be improved at the working faces. It is important to remove every obstruction to the free flow of air.

QUESTION—*Find the mine resistance when the water gage reads 2.5 in., in an airway 5 × 12 ft. in cross-section.*

ANSWER—A water gage reading of 2.5 in. corresponds to a pressure of 5.2 × 2.5 = 13 lb. per sq.ft. Since the mine resistance is equal to the total pressure producing the circulation in an airway, and the sectional area, in this case, is 5 × 12 = 60 sq.ft., the total pressure in this airway, or the mine resistance, is 60 × 13 = 780 lb.

Kennedy Predicts Coal Famine in New York; Learoyd Says Danger is Past

At a joint meeting of the Women's City Club and the City Club of New York held in the Town Hall, New York City, Nov. 27, Thomas Kennedy, chief of District No. 1, United Mine Workers of America, declared that New York City will be facing a coal famine after the first big sleet or snow storm.

Mr. Kennedy said he had just returned from an inspection of the mines and that a famine may occur. "The railroad strike has tied up the coal cars, notwithstanding all reports to the contrary," Mr. Kennedy declared. "The railroads are not able to haul the coal from the anthracite region, and with the first big sleet or snow storm New York City will be facing a coal famine."

Arthur S. Learoyd, Assistant State Fuel Administrator, had declared previously that, barring a catastrophe, New York City would be able to pull through without a shortage. There is no shortage now, he said, but the coal received is of poor quality. He said he looked for the supply to increase from now on, because the transportation situation has improved and coal arriving at this port cannot be shipped to distant points in winter.

Mr. Learoyd outlined the activities of the State Fuel Administration to control an equitable distribution of coal and eliminate profiteering. He said that the State Fuel Administrator had no control over mine prices, which were the basic source of the cost of coal to the consumer.

Mr. Learoyd said that under the direction of the State Fuel Administrator an auditing firm has examined the books of twenty dealers in New York and as a result of their examination had discovered only two cases in which a question regarding the fairness of prices arose. These questions, he said, involved only 50c. of the price and were based on varying opinions as to the propriety of the amount.

Senator Borah of Idaho, who was to have been the principal speaker, was unable to attend. He telegraphed Miss Mary Garrett Hay, president of the Women's Club, who presided.

Daniel T. Pierce, chairman of the general policies committee of the anthracite operators, also addressed the meeting. An abstract of his address appeared in *Coal Age* last week.

Pennsylvania About to Collect Tax on Hard Coal and $200,000 in Penalties

Following receipt at Harrisburg, Pa., of information that the U. S. Supreme Court had sustained the Pennsylvania Supreme Court, which had held that the 1921 anthracite coal tax law is constitutional, it was announced by Samuel S. Lewis, Auditor General, that he would proceed at once to collect the coal tax due the commonwealth as the result of settlements effected after the companies had filed their first reports during January and February of this year. These reports covered the period from the effective date of the tax law, in July, 1921, to the close of the calendar year of 1921. The amount of tax due for that period was $3,273,840.61. Of this total but $8,288.58 has been paid to the state; having been received from various small coal operators.

A penalty of 1 per cent a month will be collected from those companies which refused to pay the tax pending the appeal. The penalty is collectable sixty days after the date of the Auditor General's settlement, and it is estimated that on the average the companies are six months in arrears and that the total penalty will be between $196,000 and $200,000.

The tax on this year's anthracite production cannot be collected prior to May 1, next, the Auditor General believes. The reports on the production of the anthracite mines during the present calendar year are not due in Harrisburg before Feb. 1, 1923. If the companies desire a longer period in which to file they can obtain fifteen days additional by making application in writing. Settlements cannot be made until after the reports are checked up and then the companies have sixty days in which to make payment before the 1 per cent a month penalty becomes effective. It is estimated that the tax will amount to between $6,500,000 and $7,000,000 a year in normal years.

Deputy Attorney General Hull has announced that he will ask the Dauphin County Court to enter judgment against the seventy anthracite companies which have appeal cases pending at Harrisburg. These companies made a stipulation in filing their cases that in the event of the U. S. Supreme Court upholding the State Supreme Court and the lower court on the question of constitutionality, judgment would be entered and no further appeal would be taken.

This action will leave but a few cases which may be appealed from the Dauphin County Court. The cases of the Philadelphia & Reading Coal & Iron Co., involving over $500,000 in taxes, and of the Mill Creek Coal Co., involving a small sum, decided in the Dauphin County Court a week ago, related to questions relative to the assessment and method of assessment of the tax and other matters not allied with the main issue in the U. S. Supreme Court case. The Philadelphia & Reading company, it is said, may take an appeal from the Harrisburg decision which held the act constitutional, the opinion following the same general lines of that in the original case.

Several other cases, involving the right to tax coal used in production at the mines, the taxing of briquets and of river coal, are yet to be decided by the Dauphin County Court.

A tax of 12.2c. a ton on domestic anthracite coal will result from the tonnage tax, according to a computation made by the General Committee of Anthracite Operators.

"Based on the value of anthracite production in 1921, $442,924,084, this tax would amount to $6,641,861," says a statement of the operators.

Two companies shipping to Philadelphia have increased the prices of broken and egg coal 15c. to 20c. per ton and on other domestic sizes 10c.

Navy Asks Bids for Coal Needs Till June 30 For Ships and Philadelphia Navy Yard

Bids on coal needed by ships and the Navy Yard at Philadelphia, Pa., during the remainder of the fiscal year, which ends June 30, 1923, are asked by the U. S. Navy Department. The coal must be best quality steaming bituminous or semibituminous run-of-mine, with at least 40 per cent lump, suitable and acceptable for the uses of the naval service and must be furnished from mines on the Navy Acceptable List. Coal must be reasonably dry and practically free from slate, dirt, sulphur and other foreign substances, subject to the usual inspection and test, and must weight 2,240 lb. per ton.

Tenders for ships' use are divided into three classes. Class 1 is for 15,000 tons, to be delivered in New York Harbor between Dec. 15, 1922, and June 30, 1923. Class 3 is for 4,000, to be delivered monthly at Philadelphia—during January, 1,000 tons; February, 1,500 tons, and March, 1,500 tons. Class 4 provides for 200,000 tons, delivery to be made at Hampton Roads, Va., between Dec. 15, 1922, and June 30, 1923.

For the Philadelphia Navy Yard 15,000 tons or more of coal is needed between Dec. 15 and Jan. 31, 20,000 tons between Dec. 15 and March 31 and 35,000 tons between Dec. 15 and June 30.

Affairs in the Connellsville coke region show slight change, a few more men drifting back to work right along and the output increasing, the shortage of cars being quite a deterrent. The holiday last week curtailed output quite a little. The first dynamiting of any consequence for some time occurred early Sunday morning, Nov. 26, when a double house at the Republic plant of the Republic Iron & Steel Co. was literally blown to pieces and two men badly hurt, who are now in the Brownsville hospital. Two other men, a woman and several children received lesser injuries. The Brier Hill Coke Co. has suspended operations indefinitely in order to install some new equipment.

Illinois Mining Institute Wrestles with Mine Power Problems; 72 New Members

What is the cost of a ton of coal hoisted under a coal mine's boilers? Can the mines of the country standardize an equitable method of computing this cost? In what sort of unit should mine power be measured? How should power costs be distributed between the points of consumption? Fifty interested members of the Illinois Mining Institute, in their two-day winter meeting at the University of Illinois, struggled with these related questions on Friday and Saturday, Dec. 1 and 2, and went back to the mining fields of the state with some new ideas to think over.

The discussion was provoked by a paper read by A. J. Hoskin, research assistant professor of mining engineering at the university, who has been making an exhaustive study of the whole question of mine power under the co-operative agreement between the university, the state and the U. S. Bureau of Mines, and who, having encountered all sorts of obstacles which he knew in advance he was going to meet, laid the problems before the Institute and asked for suggestions, just as he is laying the same problems before the whole coal-mining industry of Illinois with the same suggestion. In addition, at the meeting the Institute heard a discussion by Harold E. Culver, who also is working under the co-operative agreement. Mr. Culver is trying to work out some method of infallibly identifying every coal deposit in the state, his research thus far leading him to suspect that the "well known" coal resources of the region may not be so well known after all, in fact they may be much confused in mining men's minds. J. C. Quade described, with the aid of a projecting lantern, the new No. 4 Mine of Big Creek Coals, Inc., the company of which he is chief engineer. All this took place Dec. 1 in the student union building at the university.

That night the Institute banqueted, with John G. Millhouse presiding and with "speaking" by William Hall, Thomas Finch, J. E. Myers (who is a member of the miners' union), F. F. Jorgensen and Martin Bolt. The well-known mining movie, "The Story of Coal," was shown. The next morning the Institute members visited the university laboratories and experiment station, where they saw new ideas in coal washing demonstrated and where they got first-hand information about the new Wadia stage for measuring air pressure, a mechanism which was developed at the university and whose application to mine ventilation is being made by the mining department.

Before the Institute adjourned that afternoon it had decided that it should take a boat trip next summer, leaving the date and course to be charted by the Institute's executive committee. It received 72 new members and elected the following officers: President, John G. Millhouse, of Litchfield, mine inspector for District 6; First Vice-President, O. D. Wilson, of Gillespie, general superintendent for the Superior Coal Co.; Second Vice-President Harvey E. Smith, of Springfield; Executive Committee, George Larrison, E. G. Lewis, William Hall, William Kidd and Prof. H. H. Stock, retiring president of the Institute and professor of mining engineering at the university. Martin Bolt, assistant director of the State Department of Mines and Minerals, who has long served the Institute as secretary-treasurer, was continued in office.

Midwest Waterway May Be Built

There is much agitation in Mississippi River towns as well as in the southern Illinois coal fields over the prospect of Congress itself or Illinois assuming authority granted him to issue permission to locals for the construction of the Illinois section of the proposed deep waterway from Lake Michigan to the Gulf via the Illinois River and the Mississippi River.

There is a further appropriation of $20,000,000 to be voted on in December for the same purpose. This is said to be a forerunner of the opening up of a waterway to the Big Muddy fields from the Mississippi through the coal fields of Jackson, Williamson and Franklin counties.

This will almost eliminate all rail rate from these fields to all points on the Mississippi River from New Orleans up to Dubuque or farther north. The West Kentucky Coal Co., of Paducah, had arrangements partly completed in September for barging retail and steam coal to St. Louis, where dock and yard sites were located. Other receiving points were to have been Cape Girardeau, Cairo, Crystal City, East St. Louis, Alton, Wood River and Hannibal. The low stage in the river channel caused abandonment of the project at that time.

Freedom for Howat Unlikely, Though New Officials Oppose Industrial Court

Recent affirmation by the Kansas State Supreme Court of the Cherokee County sentence of August Dorchy, deposed vice president of district 14, United Mine Workers, ends for the time all talk of Alexander Howat, deposed president of district 14, and the other agitators who went to jail with him early this year, being freed. Subsequently, the Supreme Court overruled an application by Dorchy's lawyers for a rehearing, but allowed a writ of error, which will permit the case to be taken to the U. S. Supreme Court. Howat's appeal was handled in a similar manner some time ago, and the United States court decided it had no jurisdiction.

Howat and Dorchy both are now in the Crawford County jail at Girard, Kan., serving sentences of one year each for calling a strike in the Crawford and Cherokee county mines of the Mackie company in violation of an injunction by Andrew J. Curran, judge of division No. 1, of the Crawford County District Court. They already have served four months of six months' sentences in the Cherokee County jail at Columbus, Kan., for violation of the Industrial Court law in connection with the same strike. At the end of the four months they were released pending an appeal. It was while at liberty by reason of their appeal that they were arrested in Crawford County and began serving the sentences which will expire next April. The denial of Dorchy's appeal, following the Supreme Court's act of some months ago in denying Howat's, will send the two men to the Cherokee County jail upon their release from the Crawford County jail, to serve the remaining two months of their six months' sentences.

Howat's and Dorchy's penal history is further complicated by indeterminate sentences by Judge Curran for contempt of court. These are to be served in the Crawford County jail until such time as the two men shall consent to testify before the Kansas Court of Industrial Relations. Unless something intervenes to prevent, they will begin when Howat and Dorchy are released from the Cherokee County jail.

Since the November elections a new movement has developed among labor organizations in Kansas for the release of Howat.

"Labor organizations seem to interpret the election of Jonathan Davis as meaning that Mr. Howat should be let out of jail," Governor Henry Allen said. "I have received numerous requests in the last few days asking that I release Howat. I have no intention of doing so. Howat was placed in jail after repeated violations of the Kansas Industrial Court law, for contempt of court. It is within the provisions of the Legislature to repeal this law if it sees fit. The fact remains that Howat was found guilty of violating a state law, and as far as I am concerned he must remain in jail."

Howat sympathizers received no greater comfort from Judge Curran when they approached him a few weeks ago with a petition for the release of Howat and his fellow prisoners on parole. Judge Curran was defeated at the elections in November, and both Jonathan Davis, Democrat, who will succeed Governor Allen, and Daniel H. Wooley, Republican, who will succeed Judge Curran, are avowedly opposed to the Industrial Court law. It is not considered likely that Governor-elect Davis, pitted against a Republican Legislature, will be able greatly to change present conditions. He will, however, have the power of parole, as also will Judge-elect Wooley.

Coal Commission Seeks Constructive Remedy for Future Rather Than Placing of Blame for Abuses in Past

By Paul Wooton
Washington Correspondent of *Coal Age*

The chimney at the President's Coal Commission is beginning to draw. The staff is practically complete and its members are getting in step, so that everything will be ready shortly to apply forced draft, which must be used if the preliminary report which must be presented by Jan. 15 is to be of moment.

The point has been reached where the interest of the public and of the industry is beginning to turn to what is to be said in the Jan. 15 report. The anthracite operators evidently expect the commission to say in a concrete way what is a fair and a just wage. It will be recalled that the anthracite operators withdrew their demand for arbitration only when they obtained from Senator Pepper the assurance that a commission would be appointed to determine, among other things, the amount of the wage thought to be reasonable and equitable to all concerned.

There is no disposition on the part of any branch of the industry to expect a complete report on Jan. 15. There is a disposition to avoid pressing the commission now, as it is fully expected that the commission will express itself rather fully on that date and at least will foreshadow the scope of the final report.

The retailers made an exhaustive report to the commission. While much of the material presented hardly is pertinent to what the commission had in mind when it called for suggestions, no effort was made to play to the galleries.

The conference with the transportation representatives revealed the great importance which the commission is attaching to the part transportation plays in the coal business. It already is apparent that the commission is set on working out a constructive remedy for the future rather than trying to determine who may have profiteered in the past. It is equally plain that industry is going to co-operate fully in efforts to suggest economies in the production and distribution of coal, whether or not the same measure of help is given in developing facts with regard to wages, profits and cost of living.

The commission is being helped materially by the fact that the Interstate Commerce Commission is dealing at this time with certain fundamentals of coal traffic. At the same time the Interstate Commerce Commission undoubtedly will benefit by the studies being made by the Coal Commission because the ultimate decision on assigned cars and as to mine ratings can be intelligently made only in the light of the whole business of fuelling the country. The evidence being brought out at the Interstate Commerce Commission hearing could not have come at a more fortunate time for the Coal Commission. The information being developed fits into the needs of the Coal Commission so well that the Interstate Commerce Commission, in effect, is acting as a subcommittee to the Coal Commission. The value of the material is enhanced by the fact that the Commerce Commission is taking into consideration the disruptive influence on labor exerted by assigned cars. This is something of a departure for the Interstate Commerce Commission, since it has usually insisted on confining its inquiries to transportation aspects only. For instance, the Commerce Commission was unwilling to use its powers to prevent export of coal during the emergency, on the ground that it would be using these powers for an ulterior end.

Western Pennsylvania Operators Organize To Assist Commission Probe

Western Pennsylvania coal operators have perfected an organization to map out plans to assist the United States Coal Commission in its investigation of the industry. They held a meeting for the purpose in the William Penn Hotel, Pittsburgh, Pa., Nov. 28. Samuel A. Taylor was chosen chairman and Richard W. Gardiner secretary.

A committee of five was appointed to represent the various interests at the gathering. C. W. Gibbs was chosen to represent the Freeport Thick Vein Association and M. D. Kirk the Pittsburgh Coal Producers' Association. The independent operators will choose a member and the non-commercial operators a member, and a fifth is still to be chosen. An annual output of about 30,000,000 tons of bituminous coal was represented. The committee to be chosen will co-operate with the bituminous operators' special committee under the auspices of the National Coal Association.

J. B. L. Hornberger, vice-president and comptroller, announced the withdrawal of the Pittsburgh Coal Co. Mr. Hornberger said, however, his corporation was in hearty accord with the plans of the conferees and the work of the national organization of the industry as represented by their bituminous operators' special committee.

Operators will be assessed 4 mills per ton of production for the period from October, 1922, to April, 1923, to pay the legal and other expenses incident to the work. John W. Davis, former solicitor general of the United States, has already been retained as advisory counsel for the national committee. Another of equal ability will probably be employed, it was stated.

These were among the delegates to the conference: A. P. Cameron, Westmoreland Coal Co.; K. P. Lewis, Somerset Coal Operators' Association; George H. Hoke, Duquesne Coal Co.; W. W. Keefe, Export Coal Co.; John Jenkins, Oliver & Snyder Steel Co.; J. G. Forsythe, Virginia Coal Co.; F. C. Neale, Kittanning Iron & Steel Co.; A. R. Pollock, Ford Collieries Co.; George H. Moses, Republic Iron & Steel Co.; J. D. Durg, Charters Creek Coal Co.; C. W. Gibbs, Harwick Coal Co.; Thomas F. Fear, Island Collieries Co.; James and J. G. Patterson, Youghiogheny & Ohio Coal Co.; A. H. Stockenbach, Diamond Coal & Coke Co., and J. L. Lowther, National Mining Co., a subsidiary of the United States Steel Corporation.

Mining Congress to Assist Coal Commission

The American Mining Congress has appointed a committee to co-operate with the President's Coal Commission. The committee is composed of the following: S. A. Taylor, Carl Scholz, J. H. Allport, R. V. Norris, Cyrus Carney, Howard Eavenson and W. H. Cunningham.

Railroads Pledge Co-operation with President's Coal Commission

Any assistance within the scope of the American Railroad Association will be rendered the President's Coal Commission, a large committee of transportation men representing that organization told the commission on Nov. 28. The conference was preliminary to discussion and no formal plan for co-operation was submitted. There was a general discussion of the problems of the commission. The transportation men who participated in this conference were: R. H. Aishton, president, American Railroad Association; Judge R. V. Fletcher, Illinois Central; Elisha Lee, Pennsylvania R.R.; D. D. Carr, Atlantic Coast Line; W. J. Harahan, Atlantic Coast Line; W. A. Northcott, Louisville & Nashville; C. M. Smith, New York,

New Haven & Hartford, F. L. Bloodgood, Lehigh Valley; E. E. Gray, Chicago, Milwaukee & St. Paul; W. K. Bassett, Pere Marquette; C. E. Moore, Grand Trunk; M. K. de Tarnoky, Chicago, Burlington & Quincy; W. S. Brennan, Chesapeake & Ohio; and Dr. J. H. Parmelee, Bureau of Railway Economics.

Shortage of Domestic Sizes of Anthracite Will Be 40 Per Cent, Says Spens

After a survey of the present coal situation in Pennsylvania, New Jersey and New York, it is apparent that, although there is sufficient coal in the United States, there is a definite and continuing shortage of domestic sizes of anthracite, according to Federal Fuel Distributor C. E. Spens. It will not be humanly possible to make up during this winter the shortage in these sizes, which will amount to approximately 40 per cent, states Mr. Spens.

The available sizes of domestic, as well as those of all other anthracite sizes, have been allocated to the various states in proportion to their normal consumption, and every effort is being made for equitable distribution along this line. Should any state seize any of the coal allocated to any of the neighboring states the latter will be short just so much coal, and the effect might be far-reaching, the Federal Fuel Distributor points out. In other words, the system is general, and attempts at taking the law into one's own hands will only tend toward chaos and shortage all around.

The answer to all of this is for every consumer to provide himself with a sufficient amount of such substitutes as steam sizes of anthracite, bituminous coal, coke and wood, Mr. Spens declares. There is an ample supply of steam sizes. It is a comparatively simple matter for people to learn how to supplement domestic sizes of anthracite with the steaming sizes, and there is no restriction on the amount that may be purchased and stored.

Watkins and Posten Prove Interesting Witnesses at Assigned-Car Hearing

Rather than interfere with the orderly development of the mines of his company, Thomas H. Watkins, testifying in the assigned-car case, told the Interstate Commerce Commission that he recently had purchased one thousand coal cars. The loss of these private cars means a direct loss of $250,000 a year; nevertheless, Mr. Watkins said, it is profitable to use them because it decreases the losses occasioned by inability of the railroad companies to furnish cars regularly. Mr. Watkins has been one of the outstanding opponents of the assigned-car practice for many years. His recommendations on this subject were regarded of sufficient importance by the bituminous coal commission of 1920 to embody them, as a whole, in its report to the President.

E. M. Poston, president of the New York Coal Co. and of the Interstate Coal & Dock Co., evidently impressed the commission with his contention that the assigning of cars adds as low than $1 per ton to the cost of all coal—that used for railroad fuel and for all other purposes—because the demurrage effect of assigned cars on labor is one of the principal reasons why mine workers have to be paid a high daily wage. He pointed out that only 12 per cent of the mine workers are employed in the properties which supply the railroads with coal. The remaining 88 per cent of the mine workers are engaged in producing the output going to other consumers. It is this 88 per cent which insists on a high daily wage to tide them over the idle time, much of which is caused by lack of cars.

The men in the mines furnishing railroad fuel, Mr. Poston said, have an annual wage entirely out of proportion to the annual earnings of men in other coal mines and out of proportion to the wage in other industries. This is a potent cause of dissatisfaction among railroad workers, especially those whose positions require training and skill. They are tempted constantly to demand higher wages by the fact that they see much lower grade labor paid more than they themselves receive.

In answer to questions from the bench, Mr. Posten explained why there is a surplus of coal-mine labor. One of the principal reasons, he said, grows out of the frequent periods of car shortage. During these periods the price of coal goes up to a point where a large number of small mines can be brought into operation. So as to take full advantage of the short time they will have to operate, they offer labor more than the regular scale. He cited this example: A blacksmith who is receiving $8 a day at a well-equipped mine is offered $10 by one of the mines expecting to operate only during the period of high prices. As a result the well-equipped mine has to break in another blacksmith. As prices fall the smaller mine closes up and its blacksmith is looking for a job. This example, when applied to thousands of workers, was held by Mr. Posten as being one of the main causes for the surplus of mine labor.

In addition Mr. Posten made a plea for the storage of coal by all large consumers. He declared it would be profitable to the consumers and would do much to stabilize the coal industry. He cited the practice of the Standard Oil Co. and other concerns which operate plants where great losses would entail were they forced to close, who store coal successfully. Had the railroads stored all the coal they could in 1921, he said, it would have resulted in large savings to them and might have averted the strike.

Mr. Posten told Commissioner Aitchison frankly that the service orders of the commission are frequently disregarded. When coal mines were supposed to have first call for open-shop equipment, other commodities were using these cars in greater proportion than coal, he said. Some of the divisions of the New York Central lines, he said, had 100 per cent car supply when others had only 20 per cent of the cars necessary to take care of the tonnage the mines had to offer.

Dr. Smith, Governor Marshall and Judge Alschuler, of the President's Coal Commission, have attended some of the sessions of the hearing and have interrogated witnesses.

Ohio Fuel Administration Disbands; Emergency Considered Past

On Dec. 1 the Ohio Fuel Administration ceased to function. The administration was called into being as an emergency and had been functioning slightly more than one month. It was disbanded upon the recommendation of C. J. Neal, Administrator, and Governor Harry L. Davis on the ground that the emergency which created it had passed and that the matter of fair price and adequacy of supply had been established. The administration spent about $15,000 out of the total appropriation of $1,045,967.

In disbanding the administration machinery Governor Davis commended the personnel of the office for their efficient work, stating that the people of Ohio had been saved more than one million dollars by the functioning of the administrator and his staff.

Attention is called to the fact that the law creating the administrator is in force still and if another emergency occurs another administrator can be named and will be able to start work at once.

Illinois Chamber of Commerce Avoids Union Trap Regarding Herrin Prosecution Fund

"It's none of your business" is the substance if not the words of the Illinois Chamber of Commerce in replying Nov. 28 to the demand of the United Mine Workers for a statement as to how the money is being spent which the chamber has raised for the prosecution of the Herrin massacre case. The union, exerting every effort to make it appear that the prosecution of the men charged with slaughter of non-union miners at Herrin, June 22, is nothing more or less than an attack on unionism, wrote a letter to the chamber asking seven carefully phrased questions about the defense fund. While this letter was dated Nov. 14 and appeared in newspapers throughout the state Nov. 17 and Nov. 18, it did not reach the chamber in Chicago until Nov. 21.

Agreement with Miners at Chicago on Wage-Making Plan for Country Seems Unlikely

Chicago, Ill., Dec. 5.—On the eve of the second joint conference of miners and operators at Chicago, Wednesday, Dec. 6, it was evident that no agreement with miners on a new wage-making system for the country was likely. After two days of preliminary sessions the operators were ready to propose on Wednesday to the miners that district agreements be made to replace the present plan, which expires April 1.

It was almost certain that President Lewis and his miners would refuse such a plan and the indications were that nothing else would be offered by the operators. In such a case Lewis would call the Jan. 3 wage conference on the assumption that the old four-state Central Competitive Field remains in existence until supplanted. Nobody guesses what would be the result of that.

The operators' advance meeting started Monday but did not make any definite decisions because Delegate Michael Gallagher, of Ohio, and the three men from Indiana, including Phil Penna, chairman of the joint conference, did not arrive until Tuesday. The Indiana men were delayed by a difficulty arising out of a check-off dispute. By Monday night it seemed evident that no decision could be made upon proposing to re-establish the four-state plan, which is so favorably regarded by the union. Many regions were for district agreements or nothing, feeling that some new element may be injected into the situation before January and that the four-state plan needs federal approval before it is adopted again. The bulk of sentiment was for proposing district agreements, no matter what the outcome.

On Tuesday, when the last delegates got in, this sentiment did not materially change and the battle of the outlying districts for the creation of a national policy committee got nowhere, though it was fought hard. At noon a committee was named to draft a resolution proposing that a district plan be adopted together with provision for arbitration in case of dispute and with a flexible scale to allow regions such as central Pennsylvania to fairly meet non-union competition. On this committee were both friends and foes of this plan, which everybody knew would be refused by the union as soon as they got a chance at it.

Tidewater Exchange Members Invited to Join Plea for Cut in Demurrage

Charles A. Owen, Edward Adams and James E. Manter, receivers of the Tidewater Coal Exchange, Inc., in dissolution, have sent a letter to members of the exchange inviting them to become partners to its case in presenting to the Interstate Commerce Commission a petition seeking to reduce the demurrage charges collected on coal at New York, Philadelphia and Baltimore during the two years preceding the filing of complaint, on Nov. 6, 1922, the period during which the commission has authority to order refunds.

The receivers state that they are primarily interested in this matter only so far as it concerns members of the incorporated exchange. At the same time, as they are satisfied that there is more than a fair chance to have refunded a substantial portion of these demurrage charges, which appear to have been illegally assessed, they feel that all members of the trade should be given an opportunity to join with the exchange in this matter.

Spens to Remain Until Jan. 1.

Urged by President Harding, C. E. Spens will continue as U. S. Fuel Distributor until Jan. 1. By that time, the President believes, it will be possible to declare the coal emergency at an end and suspend enforcement of the fuel distribution act.

At the expiration of his sixty days' leave of absence from the Chicago, Burlington & Quincy R.R. Mr. Spens held a conference with the President relative to his future plans. Mr. Spens is reported to have believed that the emergency had been sufficiently relieved to make it unnecessary for him to remain any longer. In compliance with the President's wishes, however, he agreed to remain.

Illinois Miner Draws $301 in a Single Pay, Averaging $2.69 an Hour

Laurels for high, wide and handsome pay drawing might descend upon E. Friese, a miner employed in the new Zeigler No. 2 mine at Zeigler, Ill., operated by the Bell & Zoller Mining Co. Friese won attention the first two weeks in October by earning $301.29, which netted him $276.24 after various deductions had been made. The deductions were $4.71 for supplies, $14 for powder and union check-off, and special dues totaling $6.34. Computing his pay by the hour, this man can be credited with earning at the rate of $2.69 per hour.

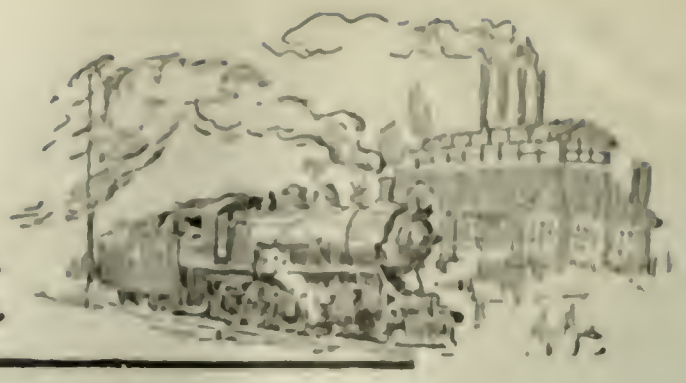
Woodin Asks Aid to Curb Gougers

With improved prospects for larger coal deliveries, William H. Woodin, State Fuel Administrator for New York, Dec. 4 took steps to curb profiteering in the prices of steam sizes of anthracite coal, which he has recommended to householders as a suitable substitute for domestic sizes.

After a conference with a committee of anthracite operators Mr. Woodin sent a letter to Mayor Hylan of New York City stating that the mine owners had agreed to give emergency aid to parts of Brooklyn, and this relief probably would become effective within forty-eight hours. Similar aid for other sections of the city suffering from inadequate fuel supplies, it was explained, may be given if the situation requires.

Announcement that several railroads had stopped coal deliveries to the Northwest via the Great Lakes was construed by coal dealers to mean that additional shipments probably would be turned into New York and other Eastern districts.

While he could not authorize a maximum price for domestic sizes, such as nut, grate and egg coal, between the mine prices of such coal varied, Mr. Woodin said he wanted information from persons who believed that they had been charged too much for coal, particularly the steam sizes. He said that buckwheat sizes should range from $8.20 to $10.50 a ton.

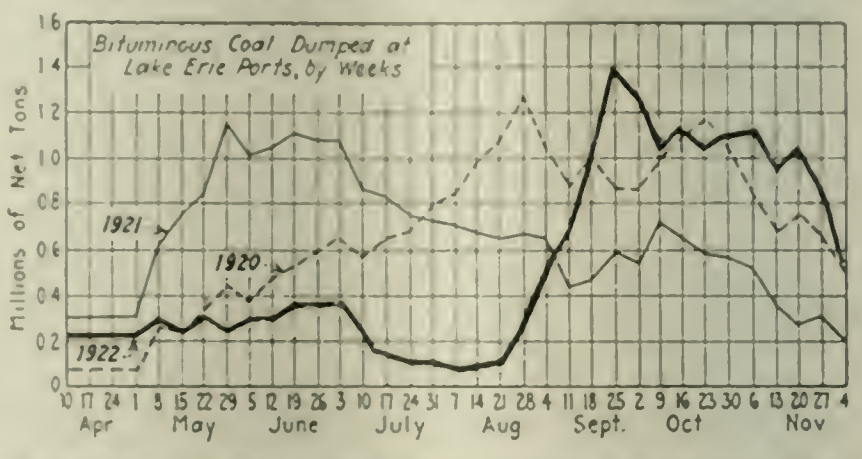


Short-Circuit in Powder Keg in Cherokee Mine Blast Traced to Carelessness

Carelessness in transporting powder within the mine was the cause of the explosion, Nov. 25, in Hamilton mine No. 6, near Cherokee, Kan., operated by the Cherokee Coal Co. under lease, according to a report by James Sherwood, Kansas state mine inspector. Thirteen men were severely burned in the accident, which followed the contact of a 25-lb keg of powder with the positive post of the battery and the metal frame of the motor of the car in which the powder was being hauled. A short-circuit was caused, which ignited the powder.

Mr. Sherwood declared he warned George Folsom, mine foreman, the week before the accident against carrying exposed powder kegs on the motor. The Kansas mining law requires that all powder hauled by electric motor shall be protected by an insulated box. The steel cover of the motor which was carrying the powder at the time of the explosion had been torn off, and the insulating plate of wood fiber beneath it had been broken to such an extent that the terminals of the battery were exposed.

Production and the Market

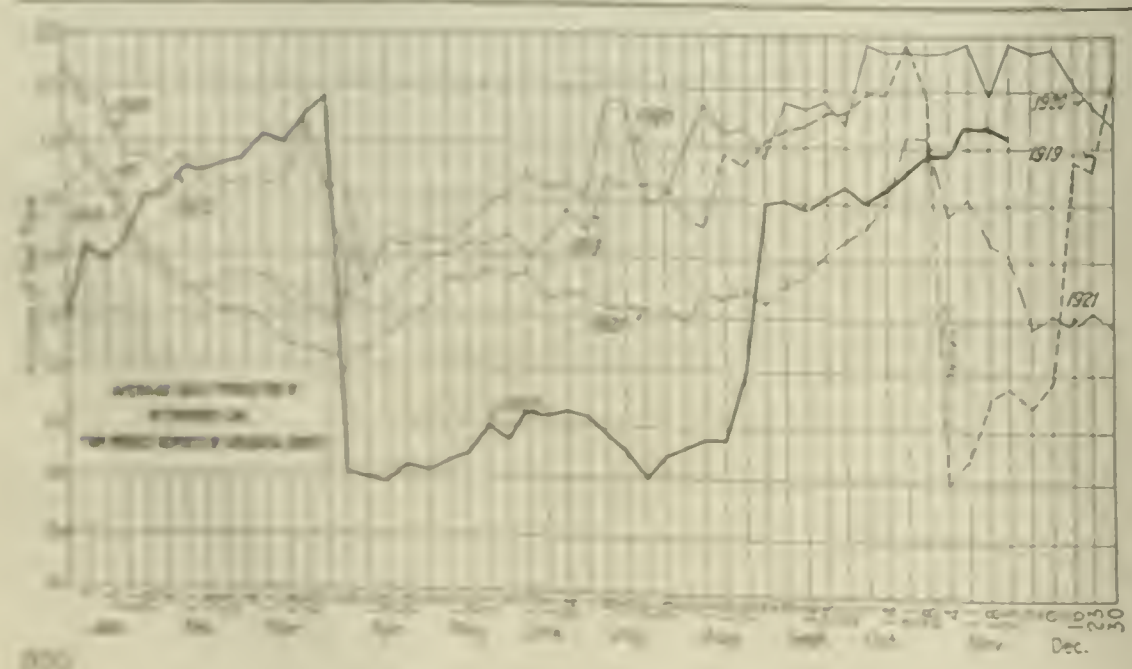


Weekly Review

Cold weather has injected more life into the domestic bituminous-coal market but has failed to stimulate the call for industrial fuels for the country as a whole. Steam prices continued to slump last week, more than overlapping the strength in domestic fuels. *Coal Age* Index of spot bituminous coal prices dropped to 326 on Dec. 4, as compared with 330 on Nov. 27. The average mine price stood at $3.91, a drop of 4c. from the previous week.

Strongest Market in Eastern Sections

Eastern sections present the strongest market today both for industrial and prepared coals for home consumption. Good steam grades are increasingly difficult to obtain and this distinct evidence of a growing scarcity has enhanced the values of medium and low qualities. Transportation conditions make deliveries difficult and requests for tracers show how closely the consumer has been buying. Although buyers feel that the flurry is only temporary and will be relieved now that the Lake season has closed, the market is very sensitive, as evidenced by immediate price raises when demand increases even slightly.



Cessation of Lake shipments has had a depressing effect on Eastern Inland markets and the Cincinnati territory also has felt the softening tendency caused by the diversion to commercial channels of 1,000,000 tons per week of Lake coal. Consumers are not apprehensive over a coal shortage despite the warnings issued by the trade that transportation conditions undoubtedly will be inadequate when severe weather comes. With prices far from showing any stiffening, industrial users have no incentive to make forward commitments and demand is not commensurate with output. Domestic coal, on the other hand, is increasing in price and cold weather is steadily enlarging the market. Control of prices in Ohio was suspended Dec. 1, which has resulted

in a better movement of home-mined coal within that state.

Chicago and Midwest markets have experienced enough of a pick up in demand to hold prices firm. Domestic buyers are taking coal sparingly and steam users are still extremely cautious. Screenings are steadily stronger, however, evidently because large consumers are not so sure they can get the necessary tonnage so promptly at a later date. Kentucky fields—eastern and western—are in a price battle, with the latter taking more of the domestic business by selling at slashed figures.

The Northwestern market is full of soft coal. Steam demand is only fair but wintry weather has strength-

(a) Subject to revision (b) Revised from last report.

ened domestic coals. Docks are cutting prices on industrial fuels to meet all-rail competition in the lower part of the region and the markets in this section are upset.

Consumers of domestic anthracite are now faced with an immediate shortage. Colder weather has increased consumption to the point where retailers are unable to cope with the demand. Thus the householder is forced to buy substitutes for the desired family sizes. Buckwheat is moving better, coke and briquet sales are improving and bituminous coal in domestic sizes is in increasing demand in Eastern sections where hard coal has always been used.

The Pennsylvania state tax, having been upheld by the Supreme Court, has caused two companies to increase domestic prices 10c.@20c. at the mines. At this writing no price changes have been announced by the balance of the old-line producers, although the tax question is the subject of much comment in the trade. Independent quotations are higher, much of the coal moving at the increased prices recently authorized by the Pennsylvania fuel authorities.

BITUMINOUS

"Bituminous coal production appears to have found a temporary level just above 11,000,000 tons per week," says the Geological Survey. "The total estimated output during the week ended Nov. 25, including coal coked, mine fuel and local sales, was 11,038,000 net tons. Preliminary reports of cars loaded during the first three days of last week (Nov. 27-Dec. 2) indicate that production continued at about the same rate, but on account of the Thanksgiving Day holiday the total output probably will drop to between 9,300,000 and 9,700,000 tons."

PRODUCTION OF BITUMINOUS COAL IN OCTOBER AND CUMULATIVE OUTPUT FOR FIRST 10 MONTHS OF LAST 10 YEARS

Year	October Production (Net Tons)	Calendar Year to Date (Net Tons)
1913	46,184,000	394,000,000
1914	37,683,000	353,000,000
1915	44,140,000	373,000,000

* Net tons, f.o.b. mines. † Advances over previous week shown in heavy type; declines in italics.

Coal Age Index 224 Week of Dec. 4 1922 Average spot price for same period, $4.50. This diagram shows the relative, not the actual prices of bituminous coals representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportional sizes of stock, prepared and run-of-mine normally shipped and second with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1913, as 100, and the ensuing results appear in the report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board.

All-rail movement to New England declined during the week ended Nov. 25. Cars forwarded totaled 3,024 as compared with 4,286 in the preceding week. The improvement in that market predicted a short time ago has not materialized and from present indications not much buying is expected for the balance of the year. Prices on quality

coals from central Pennsylvania are firm, mainly because of the car shortage.

The Hampton Roads market is rather soft. Prices have failed to hold their recent advance despite the fact that

Car Loadings, Surplusages and Shortages

	Cars Loaded All Cars	Cars Loaded Coal Cars
Week ended Nov. 18, 1922	99,094	205,024
Previous week	953,909	188,312
Same week in 1921	790,363	168,438

	Surplus Cars All Cars	Surplus Cars Coal Cars	Car Shortage	
Nov. 15, 1922	4,945	...	158,236	42,827
Nov. 8, 1922	4,406	2,046	174,498	45,529
Same date in 1921	140,000	60,000	...	...

accumulations are not as heavy as they were two weeks ago. Dumpings during the week ended Nov. 30 amounted to 236,727 net tons as compared with 211,415 tons in the previous week. The Western and line trade is more attractive, but the slow return of cars does not permit a heavy movement in that direction and enough coal is therefore reaching Tidewater to amply fill all orders.

Lake business is nearly over. Dumpings during the week ended Dec. 4 were 541,175 net tons—521,456 tons cargo and 19,719 tons vessel fuel. This week's tonnage shows a large decline. The movement for the season to date is 18,978,132 tons as compared with 23,171,449 tons in the corresponding period of last year. There is plenty of soft coal at the Head-of-the-Lakes to supply adjacent markets and the all-rail shippers can be relied on to furnish the requirements of the lower end of the territory.

ANTHRACITE

Production of anthracite was 2,174,000 net tons during the week ended Nov. 25 as compared with 2,191,000 tons in the preceding week. Thanksgiving Day idleness is expected to reduce the output for the week ended Dec. 2 to approximately 1,800,000 tons.

Domestic users face a certain shortage, and buying of substitute fuels is increasing. Certain producers stopped shipping to the Lakes on Nov. 25 and the supply for Eastern centers is expected to increase soon. The Lake dumpings at Buffalo dropped to 98,230 net tons last week as compared with 151,450 tons in the preceding week. Steam coals are in better shape with the colder weather, although the output is still topheavy.

COKE

Production of beehive coke was 285,000 net tons during the week ended Nov. 25 as compared with 264,000 tons in the previous week. The Connellsville output was heavier than for any week since the first week in 1921. Prices are firm but there is no great market activity shown.

Foreign Market And Export News

British Output Recedes Slightly

Continental demand has fallen off in Wales, owing to the depreciation of European currency, especially the French franc. Prices are fairly well maintained, however, although slight variations occur owing to growing congestion at the ports. There is excess of the smaller and lower grade coals.

Production during the week ended Nov. 18 was 5,376,000 gross tons, according to a cable to *Coal Age*, as compared with the preceding week's output of 5,441,000 tons, the record for the year. Foreign buyers hope a price cut will follow the heavy production.

Despite the recession in Continental demand, South American markets are very active. This is due mostly to the absence of American competition. The weakness of small coals is attributed to slackness of the patent fuel industry, though bunkers are selling fairly well.

The North England market is affected to the same degree as in Wales. Orders, however, are still being booked for the United States, and the Argentine and the East are also in evidence. Collieries are in no need of fresh business as long as contractors call for full quantities.

French Collieries Still Active

Nord and Pas-de-Calais collieries remain active. Sized coals for domestic uses are still extremely scarce. Demand for industrial coals exceeds the present output.

Imports of British coal by France are increasing — 999,000 tons in October as against 886,000 tons in September—but, owing to the present high rate of sterling and to the liveliness of the demand, French collieries are not yet feeling the pinch of this competition.

The situation of the Loire and Center fields is much improved, as is also the case in the southwest, whence a good export trade to Spain and Italy is being carried on. Owing to the fall of the mark, shipments from the Sarre to south Germany are now decreasing; but those for German railways remain important. Substantial supplies of Sarre coals also go to Switzerland and Austria. Production of the Sarre in September was 985,000 tons, as compared with 1,019,000 tons in August. Pit headstocks on Sept. 30 were 467,000 tons, 75,000 tons less than on Aug. 31.

Germany delivered to France, during the first ten months of 1922, 3,680,000 tons of coke on reparation account, against an amount due of 3,923,000 tons. She under-delivered 66,000 tons of coke in August, 9,000 tons in September and 25,000 tons in October. France needs about 650,000 tons of coke per month, against which she can only reckon in the near future on a supply of 550,000 tons. In order to offset the monthly shortage of 100,000 tons, French ironmasters have purchased this month 20,000 tons of British coke and are trying to obtain, but rather unsuccessfully, an increased supply of Belgian coke.

FRENCH OUTPUT IN SEPTEMBER
(IN METRIC TONS)

Coal Paragraphs from Foreign Lands

GERMANY—Another increase in the price of coal, this time amounting to 30 per cent, is announced. Unwashed fat coals are now 19,748 M. per ton.

SPAIN—The Central Hullera Asturiana having been dissolved, each mine owner is offering coal at the best prices he can obtain. This has made competition which is attracting buyers.

INDIA—The market is steady. Supplies are adequate. Quotations are: Bengal first, Rs.28; Bengal good second, Rs.26@Rs.27; English, Rs.28, and African, Rs.27½.

United States October Exports

Exports of coal and coke from the United States during October amounted to 404,999 tons of hard coal, (306,082 tons last year); 1,729,425 tons of bituminous coal, (1,330,304 in 1921), and 38,613 tons of coke as compared with 22,256 tons last year. For the ten months ended Oct. 31, 1922, there were 1,543,221 tons of anthracite exported, as compared with 3,540,564 tons last year; 7,996,158 tons of bituminous coal, (18,803,929 in 1921), and 294,594 tons of coke, (220,507 tons last year).

Trade Dull at Hampton Roads

Continued car shortage, with resultant lack of supplies at the piers, featured the week's business here. Only 25 to 30 per cent of normal supply of cars was reported, and the trade was reflecting this situation in its dullness.

Demand and supply maintained the ratio of the week before, the continued lack of coal in large quantities having caused a lethargy among buyers. Coastwise and export business were weak although bunkers moved with considerable briskness. Prices remained approximately the same. Two ships cleared for export last week.

Signs of Growing Scarcity Cause Upward Price Tendency

Difficulty in Obtaining Good Coals Increases—Even Lower Grades Advance—Consumers Buy Closely—Market on Hair-Trigger Basis—Anthracite Shortage Moves Domestic Sizes.

Good coals are increasingly difficult to procure. This distinct evidence of the growing scarcity raised prices during the week and even the lower grades registered advances. Transportation conditions make delivery difficult and requests for tracers indicate how closely the consumer has been buying. Although purchasers profess to believe that the flurry is only temporary and will be relieved now that the Lake season has closed, the market is on a hair-trigger basis, as evidenced by the rising prices with the slightest increased demand.

The shortage of anthracite is moving more domestic sizes. Producers are finding this outlet very attractive and additional mines are now running to prepared coals. High-volatiles seem to have the edge on this business because of the brighter and cleaner appearance of the coal.

NEW YORK

Indications point to a more active market and better prices. Inquiries are more frequent. The low quotations prevailing here for domestic coals do not prevent foreign coals from being shipped here. Reports show that at least one cargo of about 6,000 tons was reported as arriving in the local harbor last week.

The instructions of the Fuel Administration that substitutes for anthracite be used wherever possible ought to add to the demand for bituminous coal, but on the other hand this may be offset by the warning of the Health Commissioner against the smoke nuisance.

Transportation difficulty continues to be the one sore spot in the situation. To this may be added crippled motive power as well as the neglect of mine owners to stock up while it is possible to get coal before the roads are hampered by snow storms. Many mines are receiving few cars and some of the smaller operators are not getting any.

Good coals are hard to pick up and now the cheaper grades are beginning to feel the effects of the shortage. There were nearly 1,000 cars at the local piers the latter part of the week and 40 piers were reported working. Most of this accumulation was of grades 10 and 11.

Demand for coke was heavy during the week ending [illegible]. Gas coal [illegible] Nov. lump was quoted $4.50@$5; run of mine, $4.25@$4.75, and high-volatile steam [illegible].

PHILADELPHIA

There is distinct evidence of a growing scarcity of soft coal, especially those fuels classified under Pools 1, 71, 9 and 10. In fact, Pool 1 is really not obtainable at all. This refers particularly to the coals coming from central Pennsylvania where the car supply is reported as particularly poor. The scarcity of the good coal is such that many houses have for the time ceased soliciting new business, being in some straits to make good on commitments already in hand.

There are many inquiries for domestic, and sales of single cars to retailers grow. The retailer is feeling his way and still shows a preference for the sized gas coals, although some ground is being made in the low-volatiles of a coarse and lumpy nature. There is also fair movement in the sized semi-bituminous grades.

Prices have moved upward. Greater activity in buying on the part of the consumer will immediately show much higher quotations. However, users declare that the present firmness is but a mere flurry, and argue that when Lake navigation is off the boards there will be plenty of coal and much lower prices.

CENTRAL PENNSYLVANIA

Two things have demoralized the coal business in this district. The car shortage, which practically closed down many mines, and now comes a shortage of water which is causing operations to close down.

Car shortage is reported worse along Pennsylvania. Miners are leaving for other sections and the situation is decidedly discouraging. Operations, generally, were closed on Thanksgiving. Prices have undergone but little change, the range being as follows: Unclassified, $2.75@$3; Pools 11 and 18, $3.50; Pool 10, $3.75@$4; Pool 9, $4@4.25; Pools 1 and 71, $4.50@$5.

BALTIMORE

Prices continue about on the same level as the run of several weeks past, with the possible exception that pools 71 and 9 are shaded off a bit from the prices demanded ten days or two weeks ago when there was an especially sharp call for the better-grade fuels and the prices took a distinct advance over the usual gap above pool 10 quotations.

At this writing there is still very little of real pool 71 offering and this rating is worth $4.50@$5. Pool 9 is now offering in a number of cases around $4, although $4.25 might be a nearer quotation. Pool 10 is quoted variously $3.25@$3.40 and pool 18 is $3.50@$3.75. Pool 24 is demanding $3.

The gas-coal market is not of much interest at present although there are some quotations. Pool 64 is offered at $3.05 and pool 65, $3.25@$3.4[illegible]. While the car supply continues far below normal, and the demand at the same time is fairly brisk from local consumers and from those who purchase from Baltimore agents or concerns having headquarters in this city, the market cannot be said to be a tight one by any means.

FAIRMONT

Prices were not materially affected by the cessation of Lake shipments during the closing days of November. Mines not shipping railroad fuel are not getting much of a car supply except on Monday of each week and there is much idleness among the mines in the northern part of the state. Much difficulty is being experienced in getting coal through to Western markets owing to the shortage of equipment.

UPPER POTOMAC

At the end of November production was on a larger scale than at any time in several years, there being a weekly output of over 100,000 tons in the territory embraced within the membership of the Upper Potomac Operators' Association. Production is especially large in the Upper Potomac region. In some parts of the Georges Creek region the output is limited but operators are managing to increase production notwithstanding the fact that so many miners have refused to return to work.

West

DENVER

Coal trade here remains at a low ebb because of the continued warm weather. Domestic demand is nearly stagnant but industrial call is a little better and slightly improved car supply is helping the producers to meet every phase of this demand. Production improvement is swifter in all of the surrounding Rocky Mountain States but this may be accounted for by the fact that Colorado was less affected by the strike than were the others.

KANSAS CITY

The price reduction of $1 a ton on some grades of Kansas coal announced in Kansas City, Nov. 22, has failed to cause any noticeable increase in the demand. The weather continues mild. City folks are able to keep their homes comfortable with gas grates and ovens, and in spite of the assurance of dealers to the contrary, are holding off buying in the hope that there may be a further drop in price. Farmers in this section are stripping their farms of dead wood and lumber scraps.

The demand for industrial coal remains normal, with only occasional shortage in supply due to lack of cars. Operators estimate the mines of this district are producing 40 to 50 per cent of normal.

SALT LAKE CITY

The car situation has improved considerably and, as a result of resumed mild weather, losses will soon be entirely due to market conditions. Production is now around 50 per cent. The demand for small sizes is still decreasing. Dealers are buying for current use only, except in a few cases, in the belief that operators will soon reduce prices. Operators declare they contemplate no changes in this direction.

Anthracite

More Smaller Sizes Moving; Substitutes Sell Better

Upholding of Pennsylvania Tax Causes Two Companies to Raise Prices—Lake Dumpings Dwindle—Producers Promise Increase in Eastern Shipments—Cold Weather Halts Decline in Small Steam Sizes.

Cold weather has brought the consumer to an abrupt realization of the urgent need of substitute fuels. Purchases are being made unwillingly and sparingly, but more and more of the smaller sizes of hard coal are being moved and the sale of coke, briquets and domestic bituminous coal is improving. At this writing the high court decision upholding the Pennsylvania tax has resulted in two companies increasing prices of broken and egg coal, 15c.@20c., and the other domestic sizes 10c. Independent coals are moving at the higher figures recently authorized by the Pennsylvania fuel authorities.

Lake dumpings are declining—98,230 tons last week, as compared with 151,450 in the previous week—and producers now promise an early increase in Eastern shipments. Buckwheat is stronger and the cold weather also has checked the decline in the smaller steam sizes.

PHILADELPHIA

Increasing prices, both company and independent, have engaged the attention of the trade recently. First was the announcement of the State Fuel Commission, which had investigated claims of the independent producers for increased prices. As a result of this investigation prices for prepared sizes up to as high as $12 were approved. Some independents selling at $9.50 were allowed an increase of $1 on prepared sizes, while some of them advanced pea to $8. Following the decision upholding the Pennsylvania tax act, one of the companies advanced broken, stove, nut and pea 10c., and egg 20c., making the circular quotations as follows: broken, $8; egg, stove and nut, $8.30, and pea, $6.30.

However, it is the almost utter lack of coal that is causing the retailer extreme anxiety. The independents still continue to be the heaviest shippers locally and as a result of new prices, retail advances to $16@$17 are to be expected.

The steam market is in fair condition, but all sizes are still to be had without difficulty. Buckwheat appears at times to strengthen, due to the colder weather, and also to the fact that the retail trade is taking a slightly larger share of this size. Inasmuch as the retail men often take this size to get the larger coals they are also in turn insisting on their trade taking a proportion of it. Rice is the weakest of the trio, and barley still inclines to betterment. All steam sizes are still readily obtainable at last week's quotation on the market.

BALTIMORE

Hugh C. Hill, president of the Baltimore Coal Exchange, has tendered his resignation to Governor Ritchie, as a member of the Maryland Fuel Distribution Committee. In coal circles this is regarded as the first move to end the attempted control of the state committee, which after all has been able to accomplish little that would not have come about by the regular routine of trading.

The situation continues tense, although there is a slight betterment for the time being due to the fact that the weather has been mild for a week past. The great rush of householders demanding coal at once has let up to a slight extent. Dealers point to the fact that after nearly 1,500 cars were received in October, the November receipts dropped to almost 1,000 cars. So far, while promises have been made for a better movement for December, there is no indication that the month's receipts will run above those for November. The disinclination to use soft coal continues.

BOSTON

The local retail situation shows little change. Dealers are having a most uncomfortable time with certain of the fuel authorities who seem here to attempt more drastic regulation of deliveries than is suggested elsewhere.

The colder weather has caused considerable anxiety through this territory, but among the trade there is a distinct feeling that if we can tide over the next three or four weeks we shall then be rather better supplied than is possible at present. Certain of the producing companies stopped shipping to Buffalo for Lake shipment on Nov. 25 and already it is apparent that New England shipments will measurably increase during December.

BUFFALO

The Fuel Administration reports that it is about three weeks behind its emergency orders, and yet there is no great amount of uneasiness felt by those who understand the situation fully. They know that the reports of "not a pound of any sort of fuel" is the fault of the complainant. One of the largest local anthracite distributors states that he is burning coke entirely and finds it so satisfactory that he means to go on with it, even after anthracite in domestic sizes becomes plentiful again.

The sale of independent anthracite is brisk. Demand is so great that jobbers are in the region bidding against one another for it, even when the lowest mine price is $12.

The Lake trade continues light and is about at an end. Loadings for last week were only 98,230 net tons, of which 50,800 cleared for Duluth and Superior, 27,900 for Chicago, 8,000 for Milwaukee, 6,500 for Sheboygan, 2,500 for Racine, 2,000 for the Soo and 530 tons for Port Huron. Freight rates are strong at $1.50 to Racine and Port Huron, $1 to Soo, 75c. to Sheboygan, 60c. to Chicago, 50c. to Milwaukee.

NEW YORK

Consumers are realizing now more than ever that in order to keep their fires going they must use substitutes in conjunction with the domestic coals. This ultimatum was forcibly impressed by a few days of cold weather. Demand increased considerably and retail dealers found themselves swamped with orders. When it became apparent that substitutes would have to be taken or no deliveries would be made, dealers were enabled to move much of their buckwheat stocks, as well as bituminous coal, coke and briquets.

The affirming of the Pennsylvania tax law by the higher courts came in for considerable comment but no one in the absence of an official statement, professed to know if it would be passed on to the consumer by the producer. It was rumored that some of the larger independent producers who have been selling their domestic coals between $9 and $10 were considering the advisability of increasing slightly their prices for those sizes.

Buckwheat was stronger and there was more or less increased activity in rice and barley. Demand for these coals increased because of the colder weather. Considerable of the cheaper coals are yet available and quotations in some instances were lower than those given in the current price tabulation, which are for the better grades.

South

BIRMINGHAM

Several days of continued cold weather has further stimulated the domestic demand and will probably also create better inquiry for steam fuel if it holds on long enough. As it is, however, the steam trade is reported as being rather quiet, with spot business only being offered and that in small lots. Domestic demand has been good all along and the mines have not been able to supply trade requirements, due to car shortage and the dullness in the steam market, which has held down production in that direction. Indications are that householders will be compelled to use a considerable quantity of mine run during the winter.

The car supply for the past week has been very bad, reports indicating less than 50 per cent obtained of requirements stipulated by the mines. With few exceptions operations were maintained through the holiday, although output slumped at most of the mines.

VIRGINIA

Production has been increased, though hardly as large a tonnage is being shipped, the additional tonnage being utilized in the production of coke, the all-rail mines serving this territory, however, car supply is somewhat shorter. With production averaging more systematized than in other fields, there is nevertheless a demand sufficiently heavy to absorb the entire output

Chicago and Midwest

Cold Breezes Stimulate But Few Signs of Life

Market Generally Remains Slow, Though Small Pick-Up Absorbs Part of Big Volume of Coal Available—Prices Do Not Vary Much.

The wave of windy, raw weather which swept this region from the Lakes into the South during the past week had only mild effect upon the coal market. It did stimulate buying a little but domestic consumers bought sparingly, still counting on a further drop in prices, and steam buyers were extremely cautious. It was to be noted in more than one market, though, that screenings were in steadily stronger demand, evidently because large consumers are not so sure they can get screenings in any volume they may need at any time they may call.

All company list prices on domestic lump and egg sizes from the best quality fields are said to have been maintained, Franklin County and 6th Vein Indiana lump still bringing $3.50 in most cases, but in other fields quotations have been ragged. There is not sufficient demand for domestic sizes to absorb the lower grades even at their lower prices, which run down to $3. In Kentucky the old battle between East and West goes merrily on, with the western fields winning business by selling domestic sizes at half the price of the other.

CHICAGO

There was mild interest in the market as the week closed. Production had been light during the week, due to Thanksgiving shutdowns and the weekend let-up. This sufficiently lessened the volume of coal available so that there was a little more buying than to supply the want at the end of a week, but nobody was scrambling for coal. Even screenings, the demand for which has been fair for three weeks, strengthened only slightly. Pearl vein Indiana screenings were in some demand at $2.15@$2.40 and sold a little more readily, though in smaller volume, than did southern Illinois screenings of comparable quality quoted at $2.25@$2.50 but with a higher freight rate. A few steady small buyers continue to pay an occasional $3 for best southern Illinois 2x1-in. screenings.

Domestic trade channels continue full to the brim with coal that moves comparatively slowly. Indiana and western Illinois carefully prepared lump still brings $3.50@$3.75 in most transactions, but there is real difficulty moving domestic sizes from other fields near here and prices often take astonishing drops in order that car service costs may be avoided. There are a good many "no bills" of various sorts lined up throughout many fields. Stout efforts of producers to stimulate stocking get only moderate results. With car supply improving in several fields, notably eastern Kentucky, buyers still believe they will not be pinched for coal when cold weather sets in.

ST. LOUIS

There seems to be no desire on the part of the public to buy coal. People are still watching for a reduction in prices. The Laclede Coal Co. on the 19th announced a cut of 50c. per ton on everything for the first half of December. Their coals are not of standard grade and this has no effect on the other dealers.

The mild weather has played its part in choking off demand for coal in the city. Steam buyers too are slow and buy only from day to day. Somewhat similar conditions prevail throughout the country districts. Everyone expects lower prices. Colder weather is the only hope. Very little anthracite, coke and smokeless is moving in.

INDIANAPOLIS

Cooler weather has stimulated the retail business slightly, but there is not the activity there should be or that the retailers really expected this time of the year. The domestic consumer continues to buy his supplies in one- and two-ton lots and there are few basements in Indiana that are filled. Prices show a little increase both to industrial and domestic consumers. The domestic increase is approximately 25c. a ton on most of the prepared sizes. Foreign-mined coal continues to retail around $12.50 and $13.

Operators say there is a slightly more active demand for steam coal. Screenings have advanced about 50c. a ton but the strength on the larger sizes does not seem to be as much. A prominent retailer of Indianapolis is authority for the statement that there is a greater percentage of Indiana prepared coal being sold now than at any time for years.

LOUISVILLE

While it had been expected that eastern Kentucky would be forced to drop prices on prepared sizes, the weather man sent snow and cold weather during the week, with the result that any tendency toward lower prices was checked for the time being. It is admitted, however, that $6 to $7 a ton for eastern Kentucky prepared sizes, when mine-run is selling at $3.10@$3.75 a ton, and screenings at $3@$3.50 a ton, represents an abnormally high market, with a spread between domestic and utility coal that is unreasonable.

During the past few days the retailers have been kept quite busy handling orders of one to three tons, and with very small yard stocks on hand have been ordering coal about as fast as they have loaded it out of their yards. Western Kentucky coal has been moving into this market some St. Louis and Southern business. As a whole the field is doing fairly well considering lack of general demand. Lump coal is quoted at $3.50@$4, the average being about $3.75; mine-run, $2@$2.50; screenings, $1.25@$1.75.

WESTERN KENTUCKY

As a result of cold weather and snow as far west and south as the western Kentucky coal fields, retailers' demands for prepared coal as well as steam-plant fuel have picked up, and this has aided in checking the downward tendency of the market. Domestic sizes have been much better, due to the fact that they are being quoted at about half the price of eastern Kentucky sizes, and lower than domestic-size quotations in many other competing fields. Operators feel that they will get a fair demand for prepared during the next several months, and feel that the tendency of industrial buyers to buy lightly and often will result in a fair volume of steam business.

A better volume of business is reported from Indiana, with fair movement in Kentucky and Tennessee. Some retailers who heretofore have handled West Virginia, east Tennessee and southeastern Kentucky coals almost exclusively are now handling a considerable tonnage of western Kentucky coal because its price is $3 lower and it has a freight rate advantage of 50 or 60c. to Louisville. Western Kentucky domestic sizes are selling at $3.50@$4 at mine, while eastern Kentucky is $6@$7. Retailers are asking a gross margin of around $2.50 a ton on all domestic fuel. Western Kentucky is asking $2@$2.50 at the mine for mine-run, and $1.25@$1.50 for screenings.

SOUTHERN ILLINOIS

Mild weather, public indifference and a few of the independents cutting the prices have kept things barely going. There is no demand for domestic sizes in the Carterville field. Nut is extremely slow. The only change has been a little pick up in the demand for screenings, but this has not altered the prices much. A few of the independents are still selling nut at about $4, egg and lump at $4.50 and up, while the association operators in the Carterville field are holding it to $5.50 on domestic sizes.

Mines are working only two or three days a week, some because of no orders, some because of no cars. Everybody is looking for colder weather. Railroad tonnage is light. Like conditions prevail in the Jackson County and Duquoin field except that the demand there is slower for everything and the car supply is not good on the Illinois Central. In the Mt. Olive field everything is hard to move but a little domestic is going north and west. Steam is slow, although the last few days in the week there was an improvement. No change in prices is recorded.

In the Standard field there are "no bills" on hand at nearly all mines, all the time, on practically all sizes. Car supply totals about three days a week but the mines do not seem able to work over that even if cars were plentiful. Prices vary from $1.25 on screenings to $1.50. Railroad tonnage in both Mt. Olive and Standard fields is light, except on the Mobile & Ohio.

Eastern Inland

Market Feels Depression With Release of Lake Coal

All but Domestic Prices Slump—Cars Still Short and Deliveries Slow—Cool Weather Quickens Domestic Demand —Removal of Prices Restrictions Enlivens Movement in Ohio.

The release of 1,000,000 tons of Lake Coal per week has had a depressing effect on the Eastern Inland market. Prices have slumped on all coals with the exception of domestic. Receipts are not greatly increased, however, and there is now just a tendency of prices to hold firm. Cars are still short and deliveries slow.

Domestic coal is in active demand with the colder weather. The removal of the Ohio price restrictions is causing a better movement of tonnage within the state. There is no shortage, but retailers are busily replenishing their stocks at prices which remain firm.

CLEVELAND

The market for most grades, save domestic lump, continues to show signs of weakness. Demand eased off in rather pronounced degree last week due to the Thanksgiving holiday and the unseasonably warm weather. Buying in the spot market is dull, and consumers seem to be content to confine purchases to immediate needs.

The virtual closing of the Lakes has made it necessary for shippers to divert tonnages formerly absorbed by the Northwest into local markets. That fact has increased the available supply and is one strong reason of the present lull. Many consumers have been waiting for just this development. With prices showing no indication of stiffness, industrial users have had no incentive to make forward commitments.

Both screenings and No. 8 slack are down about 25c. Screenings are quoted at $2.80@$3.15. Slack is selling $3@$3.40. Stocks are not heavy and many industrial consumers have not more than two weeks' supply.

The total Lake movement for the season will exceed 18,000,000 tons. This is about 3,000,000 tons greater than was expected to be moved in September.

COLUMBUS

With the closing of the Lake trade cars were more plentiful for a time, permitting increased production, but this situation is now changing and there is a growing scarcity of cars.

Prepared sizes are still holding up. Dealers are buying more with lower temperatures prevailing. Retail stocks are only fair and some are rather low. Retail prices continue firm at former levels. The disbandment of the Ohio Fuel Administration Dec. 1 is not expected to change retail prices materially, at least for the time being.

Steam business is more quiet. Steam plants have sufficient reserves for the present and are buying mostly for current needs.

Ohio domestic users have to depend largely upon Ohio grades as well as those from the closer fields of West Virginia and Kentucky for their supplies as practically no Pocahontas or other smokeless is coming into the market. Anthracite is also scarce and little is to be had at present.

BUFFALO

The trade keeps up only fairly well. Either the shippers have sized the consumption and demand up badly or the conditions are still quite abnormal. It was confidently claimed for some time after the strike ended that the consumers were not buying as much as they were using and that they would soon run short. Then it was held that the car shortage was increasing so fast that it would soon be impossible to move coal enough.

Both of these claims are now to a certain extent given up, for the large consumers say that more coal is offered them than they need and the car supply in other lines, especially grain and flour, is better than it was. At the same time some of the shippers, including a few railroad officials, are still saying that the winter will show bad car shortages. It is noted that the railroads are not buying much more coal than they need.

Prices have a downward tendency, but quotations remain at $5@$5.25 for Youghiogheny gas lump; $3.75@$4.25 for Pittsburgh and No. 8 steam lump; $3.25@$3.50 for all mine run and $3@$3.25 for slack, with Altoona smithing at $6.75.

EASTERN OHIO

Because of inadequate transportation, production during the week ended Nov. 25 receded somewhat as compared with the preceding week. Output was 338,000 tons, a decrease of 9,000 tons under the previous week and about 54 per cent of potential capacity. It would not be accurate to charge the loss in production of some 200,000 tons solely to transportation disability as Lake shipping programs are now concluded, and a larger quantity of coal is seeking disposition in local markets.

Even with restricted operations the demand is not commensurate with the output. Consumers are not uneasy over the possibilities of a shortage; in fact, some of the more conservative buyers who have laid in some stocks at higher prices than those now prevailing wish to use up a portion of the higher-priced fuel before laying in further supplies.

Fuel control was suspended in Ohio effective Dec. 1, and no adverse results are evident so far as the coal consumer is concerned, except in some sections retail dealers have advanced their delivered prices 50c. because the allowance to them under state control was not sufficient to cover cost of handling. Steam prices have fallen during the week and prices on lump sizes f.o.b. mines have remained at the same level.

Cleveland industries and retail yards during the week ended Nov. 25 received 2,343 cars of bituminous coal; 1,717 of which were for industries and 626 cars for retailers. This was the third largest week during the past two years.

Based on the quantity of coal now on hand at the lower docks and in transit, it is quite likely that at the present rate of Lake transportation, some 300,000 tons will be left over.

DETROIT

Bituminous coal is a little more plentiful than in recent weeks. The larger proportion of the supply reaching Detroit is still coming from mines in Ohio. Smokeless is deficient in supply and not always readily obtainable.

There is apparently little active interest in the market on the part of local buyers of steam coal. Retail dealers also, are displaying scant interest in supply. The market conveys the impression of waiting by the buyers in the expectation that some development will occur which will make it possible for them to stock up at lower prices.

Three-quarter lump from the Pittsburgh No. 8 district is quoted $4.50; mine run, $3.50; slack $3. Hocking lump is $5.50; egg, $5; mine run, $3.50; nut, pea and slack, $2.75. Fairmont 3-in. lump is $4.50; mine run, $3.50; slack, $2.75@$3. Four-inch lump from West Virginia or Kentucky is $6, as also is egg, with mine run, $3.75 and slack, $3.50. Smokeless lump and egg holds around $8 with run of mine $6 and slack not quoted.

PITTSBURGH

The local market has become quieter still. Consumers appear to be very well supplied by regular contracts and only occasionally enter the spot market. Apparently the ending of the Lake shipping season has relieved consumers, exclusive of the domestic trade, from all concern as to supplies.

The market has developed wide price differences according to description and quality of coal. Regular Pittsburgh steam coal is quotable moderately steady at $2.75, while Connellsville steam is $2.25@$2.50. Both byproduct and gas, of the grades commonly passing in odd lots in the open market, are quotable $3@$3.25, but choice grades for particular buyers bring up to $3.50@$3.75, all for mine run. Screenings are at a premium on account of the scarcity. In sharp contrast with the steam coal market, domestic lump is in very heavy demand with unsatisfied inquiry practically every day, the current market being $4.75@$5.

Coal production in the Pittsburgh district is in the neighborhood of 40 per cent of rated capacity, depending still entirely on car supply, which is reported to increase somewhat.

NORTHERN PANHANDLE

With the closing of the Lakes it is easier to make shipments to inland West markets, the W. & L. E. and other roads having removed certain embargoes. The bulk of the product, however, is going for railroad fuel.

Northwest

Scramble for Hard Coal Continues Hopelessly On

Thus Far Much Less Than Promised Amount Has Arrived — Rail Shipments Only May Boost Cost—Soft Coal Plentiful at Level Prices.

There seems no relief for the Northwest's hard-coal shortage to be expected from Lake shipping. Promises of all sorts have been made but the coal has not been forthcoming. Prices have been for two or three weeks on the point of flight but business decency and various influences of restraint have operated to prevent it. However, there is no telling where quotations will go when the navigation season closes Dec. 15 and all-rail hard coal begins coming in.

The Northwest is full of bituminous coal. Nobody is worrying for a minute about that. Industrial demand is fair and domestic trade has been sufficiently stiffened by the wind and comparative cold of the past week to keep yards reasonably busy. Docks with a good deal of various bituminous coals on hand have begun cutting prices to meet rail competition. This has not started any orgy of buying for even the reduced dock prices do not undersell the Illinois and Indiana coal reaching the lower part of this region. It has been many a year since the markets of the Northwest were so badly off balance as they are now.

DULUTH

Contrary to expectations shipments to the Head-of-the-Lakes showed an increase this week, but even a pick up will do little to alleviate the anthracite shortage. In all, 47 cargoes arrived at Duluth-Superior harbor, six of which were hard coal. Sixteen ships made port in one day. There are reported 23 cargoes en route, five being hard coal.

The call for bituminous has not made any appreciable difference in the market of $4.50 for lump, $4.75 for run of pile and $4 for screenings which has prevailed for some time. It is a known fact that as soon as navigation closes the docks which have dropped the price will come back to 1st. The dock trade in southern Minnesota has been cut off by the fuel administrator and the demand from the Mesabi Iron Range is lighter than was anticipated.

Comparative figures show the condition of the markets here. Last year the docks were clear when navigation opened. In all 10,000,000 tons of bituminous were brought up. This year there remained 2,500,000 tons on the docks when navigation opened and about 4,000,000 tons will be brought here before navigation closes.

In anthracite the situation is different. It is estimated that only about 500,000 tons will arrive here this year, which must be added to the 400,000 tons on docks when navigation opened. Last year 1,841,000 tons were brought here. The average for the last five years is 1,700,000 tons of anthracite. This means a considerable shortage. These are government figures.

MILWAUKEE

The coal market is unusually quiet, due to fine weather. However, dealers report a steady demand locally and dock companies are shipping out coal a little more satisfactorily. There seems to be an entire absence of concern both in the city and country as to the adequateness of the winter supply. Prices continue on the old basis, with the exception that one company is receiving 50c. per ton more for anthracite than the trade generally. A modification of the present schedule of hard and soft coal prices will probably be made on Jan. 1.

In November, 15 cargoes of hard coal, aggregating 128,139 tons, reached port, making the season's receipts of hard coal to date 270,253 tons, as against 958,677 tons during the same period last year. Soft coal receipts for November number 40 cargoes, aggregating 321,765 tons, making the season's receipts of soft coal 2,267,665 tons. Last year the soft coal receipts to date aggregated 2,557,383 tons.

MINNEAPOLIS

The soft coal market is supplied sufficiently from all sides so as to keep it pretty well upset. The dock prices have had to be cut to meet rail competition. Rail shippers claim to have held their prices for the better grades. The best southern Illinois coal is held at $5.50 with reductions from that figure, at the mine, for some of the different grades. The freight to the "twin cities" is $3.55 making the price on track, $9.05—a figure which is considerably below the dock list prices.

There is no indication of much support to the market from any direction, aside from what may follow cold weather. Industrial requirements are confined to small tonnages. Buyers are fighting hard for lower prices, and will not lay in stock beyond current needs.

It has been impossible to get anywhere near the anthracite allotment of 750,000 tons, being 60 per cent of 1,250,000 tons which is assumed as a normal store. Up to the end of November, somewhere around 300,000 tons of hard coal had been received at the upper docks.

New England

Expected Improvement Fails to Materialize

Actual Buying Falls Far Below Tonnage Looked For—No Heavy Buying Likely Till Well Into New Year—Movement to Tide Ample for Spot and Contract Needs.

Improvement in the market predicted a fortnight ago has not materialized. The amount of buying then in prospect sloped off considerably, and it took much less tonnage to meet requirements than was then expected. From present indications there will be hardly any comprehensive buying until 1923 is in full swing.

Pocahontas and New River coals are again reaching Hampton Roads in volume. While accumulations are not what they were sixty days ago there is ample coal on wheels for bottoms arriving. The Western and line trade have been more attractive as to price, especially in the case of prepared sizes West, but cars are not being returned by the Western roads in sufficient number to permit heavy tonnages in that direction. Enough coal therefore is being forced to Tidewater to take care of any possible spot demand in addition to the usual contract movement.

Current quotations both at the Virginia terminals and at re-handling points here reflect lighter inquiry, sales having been made at 50c.@75c. less than during the latter part of November. Today $7.25 is an average quotation for cargo coal at Hampton Roads, while $8.50@$8.75 is the range on cars Boston to Providence for Inland delivery.

Other than scattered purchases by the industries practically the only buying is on the part of certain of the railroads. There is still a small tonnage being received from England for locomotive purposes, and there is also a fair tonnage of high-volatile being purchased for the same requirements all-rail from Pennsylvania. Prices on both are at a minimum, and we have heard no sale at more than $3.50 per net ton f.o.b. mines or in the case of English coal at more than $8 c.i.f.

Quality grades in central Pennsylvania are being held at steady prices. Output is not large, but most operators are able in spite of car shortage to make prompt shipment and also keep themselves two to three weeks ahead on orders.

At the New York and Philadelphia piers there is no improvement. Coal there is still a drug on the market, and few operators are hardy enough to take the chance of absorbing heavy demurrage charges.

Cincinnati Gateway

Smokeless and Domestic Feature Inland Trading

Market on Domestic Sizes Holds Firm—Price Cuts Continue on Fine Coals—Smokeless Trade Still on High Plane—Open Weather Prevails.

Smokeless and domestic business occupy the center of the stage so far as Inland trading is concerned. So far the market on domestic sizes has held firm in the face of the various drops that have been recorded since the closing of the Lakes, but with its ever-increasing volume of slack in its wake there has to be a giving away point somewhere and the cuts in price continue on the residue.

Smokeless business continues on the high plane it has occupied for months. More and more shipments, however, are falling into the hands of brokers, with the result that there is a full swing of business on the low-volatile lump and egg sizes around $7.50@$8 even while straight-out selling agencies are taking the same business at $5.13 a ton providing that the purchaser will wait his turn. The weather still remains open—a fatal condition for this time of year from the coal man's viewpoint.

CINCINNATI

The absence of any active buying from the steel mills and the byproduct plants has been the last of one of the agents upon which this market has rested. For weeks these industries have been a strong prop to the trade and without them gas and byproduct coals have fallen to a level where they are worth little more than the steam grades. The drop in price on nut and slack too has been given deep consideration and it would suprise no one to see an attempt to boost the domestic offerings in order to make up the mining costs. Trading from Michigan points has been slackened because of the clean-up of the coals that were standing as a surplus at the Lake ports.

Down the river came a consignment of 42,000 tons for the local harbors and Louisville. This, however, made no appreciable impression on the local prices, which are below those set by the former state fuel administration. December opened with the following retail quotations: Pocahontas lump, $10.50@11; mine run, $9.75; splint lump, $10; nut and slack, $7.50.

LOW-VOLATILE FIELDS

New River and the Gulf

New River mines are still limited to about one day's operation per week. Several times recently the price at Tidewater has softened considerably simply because of the fact that operators have been called upon to ship more coal to Tide than was necessary, the C. & O. not being in a position to handle the Western movement. There have been slight "no market" losses because of this.

Conditions in the Gulf region are not unlike those in the New River district. The fact that there is a better Western demand than there is in the East is not helping producers. Despite the fact that the market is quiet, the output hardly suffices to fill standing orders.

Pocahontas and Tug River

A considerable tonnage which has been going to the Lakes from the Pocahontas region is now available. The Western movement, however, is still somewhat short of the demand owing to limited rail facilities. There are more cars available for Eastern shipments than to the West and it is that condition which still prevents producers from doing the maximum amount of business in Western markets.

The Tug River mines are affected to the same extent as Pocahontas operations by difficulty in securing anything like an adequate supply of open-tops. Of course, some of the fuel is flowing to Tidewater but the demand is nearer par in the West and prices are better there.

HIGH-VOLATILE FIELDS

Kanawha

Inland West markets have softened under the diverted Lake tonnage. The field is not finding it possible to ship much coal to the West on a spot basis, for the mines as a rule are not working more than one full day per week. Not more than one-fifth of the capacity tonnage of the field was being produced late in November except on the line of the Kanawha & Michigan. In the East prices are on a lower level and consequently no effort is being made to find a market in that section.

Logan and Thacker

Although Logan mines are obtaining a somewhat better car supply, nevertheless the supply dropped once again after the C. & O. had made an effort to furnish more cars. Production is limited to about 33 per cent of capacity. Even with the Lake markets shut off, there is a sufficient demand to absorb more fuel than is now being produced in the region. Only a small tonnage is being sold on a spot basis, at prices ranging $3.25@$4 for mine run.

Although the closing of the Lake season has eliminated one of the outlets for tonnage originating in the Kenova-Thacker field, nevertheless with production curtailed no trouble has been experienced in finding a market elsewhere, though prices are hardly on as high a level. Much of the coal is still being moved under contract, so that there is little surplus for spot shipments.

Northeastern Kentucky

Though the field has felt the effect of the closing of the Lakes, nevertheless owing to limited production, prices have not been depressed as much as in other fields where there is a better car supply. Production hardly suffices to more than fill orders for regular customers. Much coal is still moving to Ohio points. There has been little or no recession as to lump prices, with mine run ranging $3.75@$4, gas mine run bringing even a higher price.

Coke

CONNELLSVILLE

Coke production continues to increase and is now at considerably above the immediate pre-strike level. The increases seem to be due chiefly to improving car supply.

There appears still to be practically an even balance between production and consumption of coke, whereby market prices show little tendency to change. The great bulk of the merchant production of furnace coke is going out on contract, partly contracts at set prices and partly contracts involving weekly or monthly price adjustments. Spot and prompt coke continues at $7.25@$7.50 but are perhaps not entirely as firm at this range as a week ago. For regular shipment over December the lowest asking price on standard quality seems to be $6, and this price has been quoted for first quarter on particularly good coke. Spot or prompt foundry coke continues quotable at $7.50@$8.

The *Courier* reports production during the week ended Nov. 25 at 178,350 tons by the furnace ovens and 74,750 tons by the merchant ovens, a total of 201,000 tons, an increase of 18,720 tons. Production was the heaviest since the beginning of 1921, and one-third greater than production at any time for thirteen months before the strike.

UNIONTOWN

Further stiffening of the coal market with the coke market holding its own marked the trend for last week. The price of steam coal in bunkering personally rose to $2 and while that price has not figured in any actual sales several for small tonnages have been closed at $2.10, mines. The market, however, for steam coal generally is quoted at $2.25@$2.50.

There has been little improvement in the car situation. Efforts of the Fayette-Greene Coal Producers Association to improve the car situation on the B. & O. have brought temporary relief at best, the supply last week being greater than for many weeks.

Practically all coke being sold now is for prompt delivery but prices continue to withstand a limited demand. So far as it is known there have been no contracts closed for first half delivery. There were no contracts in force for the last half of this year because of the strike situation.

BUFFALO

Demand is good locally on account of the failure of many coke plants to produce as much as is needed. Followers of the general market report prices slack and lower at $7.50 for foundry, $6.25 for furnace, $6 for stock and $8@$10 for chestnut, as domestic trade.

News Items From Field and Trade

ALABAMA

A coal coke and storage yard with a capacity of 1,000 tons is being constructed at Lock 17, Birmingham, under the supervision of government engineers from the office in Vicksburg. The yard is being provided for the purpose of keeping a good stock of fuel on hand and preventing a possible shortage at any time.

Lieutenant E. P. Eldridge who has been the representative of Fuel Inspector Evans in the prosecutions started, for several weeks closed his office Dec. 1. **J. B. Ford**, representative of the Interstate Commerce Commission in the investigation of car shortage, also discontinued this work Dec. 1.

COLORADO

A "closed shop" campaign in Colorado is planned by the United Mine Workers of America, according to a report received at the office of the state industrial commission from various mining camps. Many locals have gone on record favoring a law which will probably result in the expulsion of all non-union workers from Colorado coal mines. The proposed law may provide for a rigid examination of all miners applicants by boards composed of mine and miners. As in Illinois the plan would be to have mine fire inspectors on these examining boards. Several years ago a similar bill failed to pass the Colorado general assembly.

Nine members of the state ranger force have resigned, according to Col. Patrick J. Hennessy, adjutant general and superintendent of the rangers. It is reported that former state Representative Anderson Arnold, a former coal miner who interested in coal properties, a captain company during the war, is slated to succeed Col. Hennessy.

Every miner employed by the Juanita Coal & Coke Co. at Berwind was given an order, according to an official notification received by the state industrial commission from the company's office at Pueblo, for refusal for the strike was indorsed in the congress, but it is reported that the men have said to have complied of the union. An investigation has been started by members of the commission. The men, it is said, have violated the state industrial act by failing to give notice of the contemplated walkout. The strikers are liable to criminal prosecution.

ILLINOIS

A party of coal operators and engineers from the Pennsylvania fields is touring southern Illinois inspecting the various mining methods and appliances used by the miners and may try to introduce similar methods of mining for coal and gas in Pennsylvania. The party is headed by Gen. Wm. P. Duvall, representative of the Interstate Commerce Commission in the investigation of car shortage, also discontinued this work Dec. 1.

H. H. Hasselman, chief engineer of the Pennsylvania Coal & Coke Co., of Creighton, Pa.; **S. W. Blakeslee**, general superintendent of Cleveland, O.; **J. George Nicholson**, general superintendent of the Pittsburg Coal Co., Pittsburg, Pa., and **William Pattinson**, mining engineer at Uniontown. The party inspected the mine rescue stations at Carterville, Duquoin and Benton and visited mines at West Frankfort, Marion, Murphysboro and other large mining centers.

The operators of the **Central Illinois Coal Trade Association** have announced that the annual meeting of the association will be held in the Old Colony Hotel, Chicago, on a date to be fixed by the officers of the association. The Illinois Coal Co., **W. A. Bridley**, former manager has gone to Illinois mining land in Egypt on the Paducah & Illinois railroad which are owned by **George Brandon**. The mines were soon due to resume.

D. L. Carr, formerly general freight agent of the Chicago & Alton has been appointed sales manager of the Sangamon County Mining Co.

The office of the Illinois Coal Operators' Association was moved last week from Springfield where it has been for ten years to the Peoples Gas Building, Chicago, in order that it may be closer to the headquarters of the executive committee of the association. Secretary C. E. McGaughey is moving to Chicago and will continue to serve the association.

M. E. Peltier, vice president in charge of operations for the Peabody Coal Co., Chicago, was pleasantly reminded on Nov. 11 that the day was the forty-eighth anniversary of his birth. His staff decorated his office before his arrival that morning and a cake bearing 48 candles was cut amid much pomp and circumstance.

Percy Kuhlman, who recently became superintendent in charge of sales for the Keystone Coal & Mining Co., Chicago, was married on Nov. 18, to Miss Margaret Ingles at the bride's home in LaGrange. Mr. Kuhlman was connected with the Sterling Midland Coal Co. at Chicago until two months ago.

The Lumber and Coal Credit Association, 53 North Clark St., Chicago, has been incorporated with capital of $10,000 for general collection and reporting business by F. J. Whiteside, M. B. Whiteside and C. D. Peck.

INDIANA

The Atomized Products Co., Evansville, producer of pulverized coal, paint products and solvents, has filed a voluntary petition in bankruptcy, listing liabilities of $96,000 and assets of $26,000. The company was formed two years ago. It erected a pulverizing plant at Evansville, but has been short of capital to develop its plans.

The Superior Fourth Vein Coal Co. has incorporated for $50,000 and has commenced developing a new mine located near Linton on the C. M. & St. P. This mine is owned by C. A. Murphy and others.

A petition asking that a **receiver be appointed for the Cathleen Coal Co.** of Greene County, to operate the mine on the property of the company and for $200 damages has been filed in superior court at Terre Haute, by Arthur D. Torr. The petition states the company is in debt to the extent of $10,000. It is alleged the property is in good condition and will pay dividends if handled properly. For this reason it was asked that a receiver be named who could proceed with the operation of the mine and in this manner settle all indebtedness.

Deeds have been filed in Terre Haute, transferring approximately 1,205 acres of land in Vigo County to the **Indiana Electric Corporation** for the purpose of operating a coal mine on and under the land purchased. The total consideration is given as $62,109. **The corporation plans to operate coal mines** to supply fuel for the electric plant to be erected on the Wabash River.

Beginning December 1, consumers of coal in Terre Haute, Ind., and other cities in the Wabash valley coal fields are favored by **a 10-per cent reduction in Indiana short-haul coal rates** for distances of 20 miles and less. If the rates had not been controlled the carload rate on coal from the surrounding mines into Terre Haute and other cities would have been 50c. a ton instead of the new maximum of 50c. a ton. Approximately 1,000,000 tons of coal are consumed by domestic users and industrials in Terre Haute annually. The new rate effects a saving of more than $300,000 a year.

William P. Boatman has been named receiver for the Cathleen Coal Co. in Greene County. The petition for a receiver was filed by **Arthur D. Torr** on the mine could continue operation. It is stated that the company has sufficient equipment to operate successfully and that with careful management all of the indebtedness could be cleared.

IOWA

B. J. Nelson, state weights and measures inspector, recently found a coal dealer in Sioux City whose **scales had been giving an extra 200 lbs. for every 1,000 lb. sold.**

KANSAS

Twelve miners were reported injured, two seriously, by a powder explosion Nov. 23, in Operation Mine No. 4 near Cherokee. About 100 men normally are employed in the mine.

Plans for a kansas state mine rescue meet at Girard Dec. 16, were completed the other day by James Sherwood, state mine inspector, Mayor J. J. Story, of Girard, and members of the Girard Chamber of Commerce. H. N. Taylor, president of the Southwestern Interstate Coal Operators' Association, and John L. Lewis, international president of the U. M. W., or their representatives, will speak.

Ballots were prepared for **a special election of officers for District 14, U. M. W. A.**, scheduled for Dec. 15. The officers will assume their duties Jan. 1, and will serve until March 31, 1923. With the assumption of office by the newly elected men, the autonomy of District 14, lost in the Howat regime, will be restored.

KENTUCKY

The Madisonville Coal Properties Co., Hopkins, has been organized, with capital of $100,000; J. B. Ramsey, B. C. Mitchell and R. H. Gatton, all of Madisonville are the incorporators.

Western Kentucky operators who sent a committee to Washington to **confer with Fuel Director Spens**, on Nov. 9, relative to maximum prices, after an appointment had been made, and found on arrival that Spens was in New York, he having wired to break the engagement after the committee had left for Washington, are a bit peeved over the matter, and have stated that if Spens wishes to discuss the problem he can meet them at Dawson Springs, as they are not wasting further railroad fare in unnecessary travel. Right now with the maximum price around $4 in western Kentucky, there is no immediate need of regulation.

It is announced at Whitesburg, that another good-sized coal development is to be launched in the Beaver Creek field, by the **Huntington Coal Mining Co.**, of Huntington, W. Va. J. M. Hall will be at the head. Contracts have been made for much of the building work, including 100 miners' houses, a modern tipple, with conveyor, to cost about $100,000, a clubhouse, Y. M. C. A., church, school and other buildings. The name of the new town will be Harkins.

Michigan capital is reported to be behind a movement for **development of a hydro-electric plant** at Parkersmill, four miles from Somerset, to furnish power for a big flour mill and for coal and timber operations. It is reported that $5,000,000 has been raised to finance the plan.

MISSOURI

Articles of incorporation have been filed with the recorder of Bates County for the **Missouri-Kansas Coal & Fuel Co.** of Worland, located on the west line of the county. The directors are, J. H. Smith of Worland, and A. A. Grammel and Geo. Grammel, formerly of Pleasanton, Kan. The capital is $50,000.

Dan C. Crane, of Springfield, has secured a lease on 280 acres of coal land near Creighton and has **opened a mine.** He has been working on the mine about a year getting it into shape. At present about 150 men are employed. The mine is equipped with electrical machinery and is modern in every way. **Several mining companies are being formed to work in the neighborhood.**

Four coal mines are being opened in the vicinity of Elmo. **C. Tuttle** and **E. E. Carver**, who opened the DeLand mines at Quitman, are developing the Elmo field.

The Big Creek Coal Co., of Kirksville, has announced that it will close and seal Mine No. 3, and it probably will remain closed for a year. About 100 men are affected by the shutdown.

NEW MEXICO

The list of dead caused by the recent explosion in mine No. 4 of the **Albuquerque-Cerrillos Coal Co.** at Madrid, remains at seven but the number of injured was reduced from about 30 to 13. Only twenty men were in the mine at the time of the explosion and all were killed or injured, officials of the company said. Cause of the explosion has not been determined.

NEW YORK

Merle D. Thompson, of Elmira, a wholesale dry goods dealer, has been appointed fuel administrator for the Sixth Judicial District, covering ten counties in the south central part of the State. Mr. Thompson succeeds Samuel J. Koerbel, who resigned Nov. 23. The appointment was made by State Fuel Administrator Woodin.

The Coal and Coke Committee, Trunk Line Territory, announces a public hearing 11 a.m., Dec. 14, at 143 Liberty St., New York City, on adjustment of rates on bituminous coal from central Pennsylvania and adjacent points and on anthracite to Boston & Maine points in Canada, including Derby Line, Vt. The proposal is intended to remove in part fourth section violations and to provide for proper alignment with rates effective to contiguous territory.

The General Electric Co. announces the formation of the **Charles A. Coffin Foundation**, consisting of a fund of $400,000, the income from which will be used to encourage and reward service in the electrical field by giving prizes to employees, recognition to lighting, power and railway companies for improvement in service to the public and fellowships to graduate students and funds for research work at technical schools and colleges. The foundation was created as an appreciation of the great work of Mr. Coffin, not only for the General Electric Co. but also for the entire electrical industry. Mr. Coffin, retired from active leadership of the company May 16 last, in his 78th year, having been identified with the development of the electrical industry since 1882.

Geo. Macnoe, manager of the Boston office of **W. B. Connor, Inc.**, has been recalled to New York to take charge of the contractors sales department, handling heating and pumping equipment.

A. E. Jones, sales engineer in the New York office of the Terry Steam Turbine Co., has accepted a position with **W. B. Connor, Inc.**, New York City, in a similar capacity.

The Merrimac Anthracite Coal Corporation, with mines in Montgomery County, Virginia, has opened an office in Buffalo and begun the sale of buckwheat size in quantity. The president, William Griffiths, of Scranton, Pa., is temporarily at the Buffalo office, but the management of the branch will be given to one of the other officers. The freight rate from the mines to Buffalo is $3.83, as against $3.28 from the Pennsylvania anthracite mines.

OHIO

The Murbach Coal & Supply Co., Elyria, has been chartered with a capital of $75,000 to deal in coal. Incorporators are John Murbach, Ralph Murbach, R. W. Rammone, J. E. Murbach and H. W. Ingersoll.

The Trio Sales Co., Cincinnati, has been chartered with a capital of $10,000 to do a general wholesale business. Incorporators are G. M. Shoemaker, W. B. Davies, W. R. Davis, Arthur J. D. Busedicer and Addison G. Durham.

The Valley Camp Coal Co., of Cleveland, which had a temporary office in Columbus during the Lake season, has closed this office and its manager, T. N. Bradford, has gone to Cleveland.

The New York Coal Co., Columbus, has been awarded the contract for 3,600 tons of Hocking nut, pea and slack for the municipal light plant at $2.75 at the mines, making $4.01 delivered in Columbus. At the same time the **F. M. Spencer Coal Co.**, was awarded the contract for 1,800 tons for the water works department at $2.65 f.o.b mines.

Headway is being made by the **Lorain Coal & Dock Co.** in the opening of its new mine in Belmont County. The mine will be known as the Lincoln No. 5 and is not far from the old Lansing mine of the company, operations at which ceased several months ago and which has since been dismantled. The company is planning for the erection of a modern tipple early in the spring.

The Creemar Coal Co. has been chartered with a capital of $100,000 to mine coal in the Crooksville district. Incorporators are S. H. Garrick, C. W. Howell, E. F. O'Neal H. C. Pugh and Hazel A. Shrake.

Bob Abbihl, who was with the Reliance Coal Co., of Cincinnati for a couple of years and who returned to the coal traffic department of the Chesapeake & Ohio Ry., was in Cincinnati recently.

President James Reilly, a coal man, of the Cincinnati Chamber of Commerce has seen that the fuel interests are largely represented at the meeting of the Rivers and Harbors Congress in Washington on Dec. 7. He appointed Captain Oscar Barrett, Captain John T. Hatfield, R. P. Gilliham and Fred Hertweg.

Benjamin N. Ford, vice-president of the Matthew Addy Co. of Cincinnati, was seriously injured on Nov. 26 in an automobile collision. Mr. Ford had but recently recovered from a serious operation.

Rush Meadows, the Cincinnati financial genius of the Big Mandy Coal Co. and the Mohio Coal Co., both of which are in the hands of the receiver, while being arranged for trial on a charge of violating the Ohio blue sky law, was arrested on a warrant issued in Jackson, Ky., on a charge of being a fugitive from justice. He was taken there for trial.

OKLAHOMA

In an **explosion of undetermined origin** in the mine of the **McAlester-Edwards Coal Co.** near Pittsburg, one shotfirer was killed. The force of 210 miners had just left the shaft. It is believed that the explosion was due to a windy shot.

The Tulsa County Coal Co., of Tulsa, has just been organized and charter filed in the office of the Secretary of State. This company owns considerable land in Tulsa County. The company is capitalized at $50,000 and the incorporators are Benjamin C. Connor, Harry A. Tallman and Eugene E. Hennig, all of Tulsa.

The Oak Ridge Coal Co. has been organized at Red Oak and will develop a vein of coal on land owned by this company near Red Oak. The company is capitalized at $200,000 and the incorporators are: Vince Davis, James Hilling and Ray Morgan, all of Red Oak.

Strikers in six mines of the Crowe Coal Co. at Henryetta, who went back to work Nov. 14, pending arbitration, are still working, although the district joint board failed to agree on the case in a two-day session in Kansas City, Nov. 22 and 23. **The dispute has been referred** to W. L. A. Johnson, commissioner for the Southwestern Interstate Coal Operators' Association, and John White, former international president of the U. M. W. Eight hundred men struck Oct. 23, because of a disagreement over the distance a machine crew should be required to move a coal cutting machine without extra pay.

PENNSYLVANIA

The Bowman Coal Co., of Trenton, N. J., announces the opening of an office in the Real Estate Trust Bldg., Philadelphia. Arch'd W. Garvin will be in charge.

Announcement has been made that **P. D. Browning**, formerly mining engineer of the Berwind-White Coal Mining Co., has been promoted to the office of general superintendent, a new office created by the concern.

Since the opening of the mines in the Monongahela River valley, more than **65,000 tons of coal are being shipped daily** on the Monongahela River by the Carnegie Steel Co., the Vesta Coal Co., Hillman Transportation Co., and the Equitable Towing & Transportation Co.

Merritt Hutton, graduate of the Colorado School of Mines, formerly chief engineer and, until recently, general superintendent for the Rembrandt Peale interests, an-

MERITT HUTTON
Mining Engineer Johnstown

nounces that he has opened an office as consulting mining engineer in Johnstown. He is prepared to make surveys, make coal estimates and give complete engineering service.

The Pine Hill Collieries Co. has applied the State Department, Harrisburg, of an extension to engage in coal mining business, having its [illegible]. W. B. Turner, Philadelphia, vice-president and [illegible].

The Pennsylvania Steam Coal Co. [illegible] has organized with capital of $[illegible] by Thomas F. Mason, Pittsburgh; Prospect C. Frost, Wilkinsburg; Chas. L. Gordon, Indiana, Pa.

The following companies have recently been granted charters at Harrisburg: **South Union Coal Co.**, Greensburg, capital, $[illegible], treasurer, Jay C. Turner, Greensburg. Purpose: Mining coal and manufacturing coke and [illegible]. Incorporators: John M. Jamison, Jay C. Jamison and Robert A. Smith, Greensburg. **L. & W. Coal Co.**, McKeesport, capital $[illegible], treasurer Herman Lewis, McKeesport. Purpose: Mining and producing coal. Incorporators: Thomas Williams, Pittsburgh; Herman Lewis and Louis Lewis, McKeesport. **Moon Run Gas Coal Co.**, Pittsburgh, capital, $[illegible], treasurer Sidney J. Kaufmann, Pittsburgh. Purpose: Mining, producing, buying and selling coal. Incorporators: D. E. Park, Brentwood; Sidney J. Kaufmann and Louis Caplan, Pittsburgh. **Reiss Coal Co.**, Pittsburgh, capital $[illegible], treasurer P. S. Snyder, Swissvale. Purpose: Mining, producing, buying and selling coal and coke. Incorporators: P. S. Snyder, [illegible] and [illegible]. Charter date, [illegible]. H. H. Gross, Crafton and Alex. Robertson, Ingomar.

Opinions in the following cases were rendered by the Pennsylvania Workmen's Compensation Board on Nov. 29: Mrs. George Sass, et al., against the **Carnegie Coal Co.**, Pittsburgh, appeal by the defendant from an award of referee; referee affirmed and the appeal dismissed. Albert Mansley against the **Pittsburgh Terminal Railroad & Coal Co.**, appeal by defendant from award of referee; referee affirmed and appeal dismissed. Ivan Lyons against the **Diamond Coal & Coke Co.**, Pittsburgh, appeal by defendant from award of referee; hearing de novo granted for claimant. Mrs. [illegible] against the **Labelle Coke Co.**, [Labelle]; appeal by defendant from award by referee; referee affirmed and appeal dismissed.

Drought conditions are so serious that tank trains have been put on to haul **water to collieries in the Schuylkill region.** The operators say they will not close down the mines if there is any water within fifty miles. They hope to obtain enough water for steam purposes for [illegible] days by the rains set in.

UTAH

The coal mines which owned a number of cars to lay off for a few days but most accomplished without much loss. By the time the origin of the fire which burned [illegible] until attacked by a force of expert mine fire fighters.

The coal operators of Utah, [illegible] coal mines for preferring, were **released without bond** after their attorneys had waged a bitter and successful fight against bond requirements.

WASHINGTON

The appointment of **Richard Prendergast Jr.**, of Roslyn, as deputy state coal mine inspector in the Bellingham district, has been announced by Edward Clifford, director of the Department of Labor and Industries. Mr. Prendergast has been engaged in mining [illegible] years, and has been a resident of Washington [illegible] years.

WEST VIRGINIA

The purchase of the mine of the [illegible] coal and a railroad [illegible] at Elgee, near Tidewater Junction, Raleigh County, by the **Howard Smokeless Coal Co.** from the Upper Coal Co. is announced. The mine is one of the largest producers of [illegible] in southern West Virginia in recent months.

The banks of Morgantown, having declined to extend [illegible] during the present [illegible] per day. It is estimated that some of the coal companies operating on Scott's Run and tributaries in Monongalia County will [illegible] a total of [illegible] tons per day. The [illegible] operating [illegible] on Scott's Run [illegible] a total [illegible] tons per day. James D. Jamison, executive manager of the **Cleveland Morgantown Coal Co.**, [illegible] that it will be necessary for [illegible] to [illegible] tons per day [illegible] to meet [illegible] [illegible] [illegible]

WISCONSIN

WASHINGTON, D. C.

J. D. Northrup has been authorized to act in charge of the coal classification [illegible] of the U. S. Geological Survey in the absence of **Herman Stabler**. Mr. Northrup will retain his duties as chief of the division of mineral classification. The work of the coal classification board recently has been changed to that of land classification board.

A substantial beginning of the active development of that vast mineral wealth which has heretofore been locked up in the public domain of various western states, but which is now to be liberated under the terms of the general leasing law, has been made, according to Dr. H. Foster Bain, director of the Bureau of Mines, in his annual report just submitted to the Secretary of the Interior. Coal is now being mined under lease in Washington, Montana, North Dakota, South Dakota, Wyoming, Utah, Colorado, New Mexico and Nevada. Coal and other mines on Indian lands are being operated in still other states. On the public lands proper the Bureau of Mines is now charged with supervision of 29 coal leases, 203 coal-prospecting permits and 5 coal licenses. The value of waste coal in mines at Wilkeson, Wash., was demonstrated, with the result that a plant for the recovery of 150,000 tons is now being erected. The difficulty in the way of using metallurgical cyanide in metallurgical work was discovered and remedied, resulting in the breaking of a monopoly in this important chemical material.

Work in connection with the leasing of mineral lands has developed so much more rapidly under the federal leasing Act, than had been expected, that the Bureau of Mines is being embarrassed seriously in its efforts to meet the situation. It has been necessary to take men temporarily away from their other duties to help the leasing and land work adjusted by the land of navigation [illegible] to which the Bureau is entitled. The anthracite situation is serious, with only [illegible] and more than [illegible] navigation [illegible]. Mercantile [illegible] tons of [illegible] coal.

ALASKA

Awards for coal have been announced by the Alaska Coal Railroad Commission for coal produced in Alaska, as follows: **Moose Creek Coal Co.**, 5,000 tons at $6; **Healy River Coal Co.**, 10,000 tons at $2.40; **Evans Jones Coal Co.**, 32,000 tons at $5.80; **Henry Baxter**, 15,000 tons at $6.50.

The Evan Jones mine in the Matanuska field caught fire on the second level on Nov. 18. Bureau of Mines men were dispatched to the mine immediately. Telegraphic advices are to the effect that the fire has been barricaded and the area flooded. Since this mine is an important source of supply of the coal needed by the government railroad, it is of the greatest importance to secure its quick return to production.

CANADA

A significant announcement was made by **Hon. D. D. MacKenzie**, Solicitor-General for Canada, in the course of an address in Toronto a few days ago, to the effect that plans were under way to supply Ontario and Quebec with **coke manufactured from Nova Scotia bituminous coal** in sufficient quantities to make these two provinces absolutely independent of hard coal supplies from the United States.

The Yellowhead Coal Co.'s mine, at Coal Spur, Alberta, caught fire recently from spontaneous combustion, and all efforts up to now to extinguish the fire have been futile. It is feared that the mine may be a total loss.

The Carbondale Coal Co., operating near the British Columbia-Alberta boundary, has commenced production. A carload of coal shipped to Cranbrook, B. C., was retailed at $4 per ton, a remarkably low figure for recent years. The company has sunk a 100-ft. shaft and driven a tunnel on one of the seams. The two main seams have not yet been developed. The coal is described as a semi-anthracite, and makes a satisfactory house coal.

In a statement just issued the Federal Fuel Advisory Committee, at Ottawa, once more warns householders that there is **little anthracite coming into Canada** and that it is important to **lay in a supply of substitutes**. Consumers are facing a situation which may lead to difficulty and possible hardship "unless the attitude of the public toward substitutes greatly alters." It will be the middle of February before the shortage of anthracite can possibly be caught up with, it is said, by which time winter transportation difficulties are generally at their worst.

The Betty mine, near Telkwa, B. C., has commenced to ship coal to Prince Rupert. Last year the mine shipped a considerable quantity of coal to both Prince Rupert and Edmonton. The coal is high grade, being in particular demand for blacksmithing. Unfortunately, the mine is 7½ miles from the railway at Telkwa, and the roads are exceedingly bad. It is possible, however, to ship over the winter snow. The seam is 18 ft. thick, with two shale partings, 10 and 20 in. thick. Owing to the nature of the country, a railway to connect the mine with the Canadian national system, it is said, would be costly.

Obituary

Traffic News

for a period of 10 consecutive days, provided that the cars so assigned shall be counted against the distributive shares allotted to the mines in said district. All regulations with respect to car service are suspended so far as they conflict with the directions hereby made.

A complaint has been filed with the Interstate Commerce Commission by the **Wyoming Coal Co.**, of Tams, W. Va., against the Virginian Ry. The complaint alleges rates on coal from complainant's mines located on the Virginian to certain interstate destinations are unjust, unreasonable, unduly prejudicial and discriminatory in so far as they exceed rates applying from mines of complainant's competitors located on the Chesapeake & Ohio in the New River district. The establishment of joint through rates is asked.

The proposed report in the case of **Edward E. Marshall vs. the Pennsylvania R.R. Co.** by Examiner Warren H. Wagner, of the I. C. C. finds rates on coke in carloads from Elkhorn, W. Va., to Harrisburg, Pa., unreasonable. Reparation is awarded.

The proposed report in the case of the **Nelson Fuel Co. vs. the Chesapeake & Ohio Ry. Co.** by Examiner J. P. Keeler finds rates on coal in carloads from mines on the Greenbrier & Eastern R.R. to interstate destinations unreasonable and unduly prejudicial. A schedule of maximum reasonable [illegible] rates is prescribed.

The Interstate Commerce Commission on [illegible] has been asked to investigate the freight rate charges on coal from the anthracite fields to Newport News and to Norfolk. The rate to Newport News is $1.50 and to Norfolk $1.65. The dealers in the former city assert that this is discriminatory and complaint against these [illegible]. Traffic interests at Norfolk have offered their assistance in lowering the rate to the sister city.

On the recommendation of the Federal Fuel Distributor the I. C. C. on Nov. 29 issued an order, effective Dec. 1, directing the C. & O. Ry. to assign to the mine of the Rhodell Coal Co. at Rhodell, W. Va., open-top cars at the rate of four per day for ten consecutive working days for movement to points in Virginia, in priority to any other use of such cars. It is provided, however, that the cars so assigned shall be counted against the share allotted to the mine and shall not be subject to diversion or reconsignment except with the approval of the commission. All regulations of the C. & O. with respect to car service in so far as they conflict with this order are suspended.

The assignment of cars for railroad fuel loading has reached such proportions as to be **denounced by operators in eastern Ohio** as bordering on intimidation, their argument being that there is no car shortage as far as the mines having railroad fuel contracts are concerned. As a result of the failure to furnish commercial mines in eastern Ohio with an adequate car supply, it is estimated that fully 10,000 miners in Belmont County are idle the greater part of the time. Operators and officials of the union have united in denouncing the assigned car system as vicious and pernicious.

Coming Meetings

Coal Mining Institute of America will meet Dec. 13, 14 and 15 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., 911 Chamber of Commerce Bldg., Pittsburgh, Pa.

National Exposition of Power and Mechanical Engineering will be held at the Grand Central Palace, New York City, Dec. 7-13. Manager, Charles F. Roth, Grand Central Palace, New York City.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 22 NEW YORK, THURSDAY, DECEMBER 14, 1922 Number 24

Evidence Must Be Unimpeachable

COLLECTION of information along two lines has been definitely inaugurated by the U. S. Coal Commission. Schedules are being sent to the coal companies asking for costs of production and realization from sales by months for the year 1921 and for earnings of men employed in the same year. Thus the two questions with regard to which there is perhaps the most controversy will be covered by comprehensive figures—the earnings of the producers and the earnings of the mine workers.

The schedules that have been adopted are rather formidable. On the cost report form there is provision for a maximum of 146 numbered items calling for 137 separate replies. Producers having less than 120,000 tons annual output are permitted to subtract 40 items from the list, leaving 97 items to answer. The longer schedule calls for a division of labor costs between 15 items, supply costs between 16 items and miscellaneous income spread over 9 items not required on the shorter form.

One may well wonder at the interest of the commission in a division of costs so fine as to set out, for instance, labor cost for "haulage and hoisting" from "dumping and tallying," while neglecting to provide for a subtotal on labor costs that would permit comparison of payroll costs from the cost form with those from the same mine in the same month on the earnings form. Just why a commission inquiring into the vexed coal question displays such interest in the allocation of supplies expense among 16 classifications, including everything from mining through drainage, ventilation and railroad-car loading to engineering is not clear. Perhaps the inspiration was afforded by a diagram prepared and circulated by the operators some time ago showing to the number of several hundred the variety of items that go to make up the cost of producing a ton of coal.

The cost statement has 110 numbered lines, of which but 29 call for figures taken from the books; 15 are totals and subtotals, 15 are blanks, 40 are the details noted above called for on the long but not on the short form, and 11 are "yes or no" questions. For the majority of producers there are but 10 questions in the remaining 35 numbered lines of the schedule that require figures taken from the books. Any producer who keeps books can easily answer the questions on the short form, and the 40 additional details of the long form are of little moment.

The schedule covering earnings of mine labor is cumbersome but complete. It provides for a year's record by pay periods of the earnings and days or hours worked by each employee by name, classified by occupation. There is but one way to ascertain what a man earns in a year and that is to trace his record throughout the year. Since dollars received on a given wage scale is a function largely of time worked—even as regards tonnage men—low earnings connote few days of work, high earnings advantage taken of the better opportunity for labor. The labor schedule makes provision for bringing out, so far as mine records will permit, the relation of the days the individuals work to the days the mines offer opportunity to work. Absolute data in this respect for tonnage workers cannot be had because, as everyone knows, it has never been possible to ascertain how many days or how many hours per day the tonnage man stays on the job. The miner prizes so highly his freedom of action, his liberty to come and go, to absent himself at will, that any attempt to check his time other than by the roughest methods is doomed to failure.

These two studies—the costs and profits of the operators and the earnings of mine labor—are the most important statistical investigation that the commission will have to undertake. They are costly both for the operators, who alone can supply the data, and for the commission, which must compile the returns. The answers from these schedules will give the American people information on those points regarding which there is and has been the greatest controversy. Facts about what the mine workers earn and the companies profit from the production of coal have hitherto been either too fragmentary to carry conviction or have been ex-parte statements, subject to partisan attack and so attacked. The Coal Commission is looked upon as the agency of the American people set up to get all the facts and certify them to the public. This question must be settled.

It is but natural that operators' associations having collected much of these data regarding costs of production and earnings of labor—data in their estimation correct and true—should desire the commission to accept their compiled returns. This, it appears, the commission will not do, for the reason that it must build its results on original sworn returns, holding that to do otherwise would lay its work open to such criticism as would annul its value and weaken its effectiveness.

To this there is no conclusive answer. Having set its face to the task of supporting the Coal Commission in its labors of getting all the facts about that industry, the coal producers must go along with the commission with this policy. Whatever would discredit the results of the commission would discredit the operators. The results must not only be the facts, they must as well be undeniably the facts. Quibbling over methods that are designed to produce unimpeachable evidence is shortsighted. Figures that the most carping critic in Congress or the cleverest publicity man for the United Mine Workers cannot assail will be worth several times what it will cost the operators to fill out all the blanks the commission may design. The coal producers should give no occasion to add to their reputation for refusing to give up the facts about the coal industry.

"Peace! Peace!" And There Was No Peace

"GENTLEMEN, let bygones be bygones," declared John L. Lewis, president of the United Mine Workers, to that famous "peace" conference he called in Cleveland in early October. Then he spoke somewhat of the need for both sides to compose their differences, make mutual concessions and for each to devote itself to the problems confronting the coal industry with due regard for the interests of the other. Forgotten indeed were Mr. Lewis' sentiments. "Now it be only seems what he says," said operators leaving that meeting, "there's hope of getting up relations with the union on a businesslike basis after all." They thought it too good to be true, but a few with hard experience in dealing with Mr. Lewis' organization went home encouraged. The others surely went home

And now that the Chicago sessions of the joint committee on methods for wage making have come to their hopeless conclusion, where is Mr. Lewis' sweet program for peace? The miners refuse to consider for a moment any method of future negotiations that would include less than the four states of the Central Competitive Field. They refuse anything and everything even faintly smacking of arbitration, partisan or non-partisan. They announce truculently that they have already decided what the next scale of wages shall be. Yet they talk of "negotiation."

Ponder the fact that there have been no "negotiations" between the operators and United Mine Workers since the conference of 1916. Mr. Lewis, in power since 1919, has not negotiated a single scale. He has forced demands on the industry by strikes. Lewis has set himself to militancy and he shows no inclination to turn back. The leader of a pack, he must keep in front or be torn apart by his followers. Credited with being at heart a conservative, he has surrounded himself with the tradition of a fighter that pursues him relentlessly.

Ponder further the conditions that will face Mr. Lewis when he determines his policy for next April. Following five months' strike idleness, will have been seven months' work averaging less than half time, with what in prospect after April 1? Large groups of mine workers will work no more than two days per week this winter, due to short car supply. Other groups will make four, five and even six days per week. In total they will get all the work for which there is demand for their product, but inequality in car supply is now making and will continue to make for better opportunity here than there.

Without stopping to argue that an industry that is so overmanned is one to leave, these short-time men will call for shorter time and greater wages. Is it not pretty clear that as against trying to take the men through a year of little work, letting the dissatisfied grouse and get out, Lewis will have the choice of holding them in line through a strike? The morale of his men is more easily maintained on strike than working a day or so a week, no matter what the wage. And then he has the reputation of winning strikes. Does any of this "augur well for the future relations" between operators and miners? Mr. Lewis said the October conference developments did.

On the other side the question now is: Can the operators afford to avoid a strike next April at the expense of continuing a wage scale that will inevitably result in shutting down mines for lack of a market willing to pay the cost of coal? Is a strike any worse than that? It cannot honestly be said that a majority of operators want to precipitate a strike. Turmoil has damaged the industry enough already. It can honestly be said that most thinking operators earnestly desire friendly relations with labor and some radical change in the industry to permit it to operate on business principles. It can further be said that most of them earnestly seek some way to put their industry right with the people. But unless some new element is introduced between now and April 1 there is grave doubt as to the propriety of any course that now seems open. The situation is, indeed, one to give concern to the coal operators of America and the public.

Abusing the Check-Off in Indiana

IF PROOF were ever necessary—or valuable—to show that the United Mine Workers are ever ready to violate the terms of their contract agreements with operators the present check-off case in Indiana is a fair citation. There the union has not hesitated to abuse the sacred check-off, which is already under suspicion by the courts, and to bring to the fore, where all may see, evidence that the check-off is a spigot which can be tapped with more or less ease whenever the organization needs money. If the present intent is to amass a greater strike fund against the developments of next April, why should not the operator of that state fight back vigorously?

The battle is over the question: "What are union dues?" Under the agreement the operator "shall offer no objections to the check-off for the checkweighman and for dues to the U.M.W. of A." Ever since the signing of the contract 50c. a month has been checked off for the national union organization. Now the union is demanding $2 a month for November and December for the national. This, the operators contend, is a special assessment and not regular dues and therefore is not collectable. They hold a letter from John Hessler, president of the Indiana union district, calling it a special assessment—a letter written before the present dispute came to a head.

Whatever the justice of the debate over the meaning of the word "dues," the damning point in the case against the union is that during the past month, when the special assessment of $2 was supposed to have been collected, check-off increases of various amounts made by secretary-treasurers of the locals did not specify $2 for the national at all. Neither were these increases uniform. The explanations given by the locals varied widely. In one instance a secretary-treasurer explained that the union dues had to be increased because he was a new man on the job and had underestimated his expenses. In other cases there were astonishing increases in burial and sick-fund items, and all sorts of surprising boosts in initiation fees appeared. In one local this increase was from $10 to $50, in another to $100. The fact that several operators paid these increased check-offs in November through misunderstanding and through their not being alive to what was going on is no cause for the balance of them paying it now.

It will be recalled that in 1921 the Pittsburgh operators refused to collect a special assessment for the union under the check-off, an assessment the purpose of which was to support the Mingo war. Because the operators had certain knowledge of the use for which this money was designed, the union did not press the claim, and the "dues" were not collected.

Choosing, Lubricating and Attaching Wire Ropes*

Hardness and Tensile Strength Found in the Same Rope but Flexible Rope Is More Subject to Wear—Lang-Lay Rope Stronger Than Regular Lay

By J. F. Howe†
Worcester, Mass.

SELECTING the proper type of wire rope for each kind of coal-mining service is an important duty for the engineer. A study of the various materials used in wire rope is of interest because a knowledge of the physical characteristics of the wire composing the rope will give a fairly good idea of the way in which a rope will behave when it goes into service. Four kinds of wire ordinarily are used in wire-rope manufacture:

Crucible-steel hoisting rope, composed ordinarily of materials of a tensile strength ranging from 160,000 to 200,000 lb. per square inch.

Extra strong crucible-steel rope, composed of materials of a tensile strength ranging from 200,000 to 220,000 lb. per square inch.

Plow-steel rope, composed of materials of a tensile strength ranging from 220,000 to 240,000 lb. per square inch.

Special improved plow-steel rope, for which each manufacturer has his own trade name, composed of materials of a tensile strength ranging from 240,000 to 280,000 lb. per square inch.

Tensile strength is not the only characteristic of the wires; others must be borne in mind. Mention was made in the first part of this paper of the importance of hardness and of the relative value of these steels when they are compared with this physical property in view.

In addition to the test for hardness, wire for rope must stand certain ductility tests. Even the hardest wire must meet a high ductility test, else it is unsuited for that purpose. There are cases where hardness is required in wire to withstand abrasion or rubbing, and in those cases either plow steel or monitor grade usually is required. From the standpoint of tensile strength alone, it may not be necessary to use this material; but in order to get maximum service, it frequently is necessary to use rope of the greater strength in order to get the harder steel and the life that goes with it.

In every rope installation two factors must be considered, the cost of installing the rope, including the time lost in so doing, and its original cost. It frequently happens that the cost of installation is a large percentage of the original cost of the rope; anything that can be done, therefore, to increase the life of a rope would cut down not only the original cost but part of the cost of installation.

It always is advisable to use a rope of standard construction unless the service it renders is unsatisfactory, and then only such special constructions should be considered as offer promise of reasonable improvement in service. If, for instance, a plow-steel 6 x 19 hoisting rope wears out too fast, a monitor or improved plow-steel rope would afford a harder wire and probably the added rope service desired. If not, then an effort should be made to reduce the friction. The ropemaker should not be called upon to produce greater efficiency unless the mining engineer has done his part. In case of a bad overlay on the drum, however, a mining engineer can do little to better conditions unless a larger drum can be provided. In that event it is the ropemaker's problem to propose a special construction or quality that will meet the stresses that the overlaying of the rope introduces. In some such cases a flattened-strand rope, 6 x 25 construction, has given excellent results, and in other cases a Seale patent, 6 x 19, or modified construction such as 6 x 16 has produced the results desired. Lang-lay ropes often are better than regular lay for shaft ropes where overlaying is unavoidable.

Lang-Lay Rope Used for Many Years Abroad

Many opinions have been expressed as to the respective merits of regular-lay and Lang-lay rope. The standard rope used in the United States has always been one of the regular lay. Without delving too deeply into the reasons for this, I might say that this probably is due largely to the fact that the regular-lay rope is more easily produced and in general is more satisfactory to the user than the Lang-lay rope. The latter rope is not, however, a new style of rope construction. It is as old as the art itself, having been brought out almost simultaneously in both England and Germany—in England by Lang and in Germany by Albert.

A Lang-lay rope is one in which the wires in the strand and the strands in the rope are twisted in the same direction. Lang-lay is never used in hemp ropes, because a hemp rope would not hold together if made in this manner. Perhaps this is one of the reasons why the ropemakers have fallen into the habit of making regular lay rope instead of Lang-lay.

In the regular-lay rope the wires in the strand and the

---

*Second instalment of an article from a paper entitled "A Discussion of Wire Rope as Applied to Mining Operations" read at the fall meeting of the Rocky Mountain Coal Mining Institute. The first part of the article, "Wire Rope Is Dumb but Improper Installation and Careless Operation Quickly Destroy It," appeared in *Coal Age*, pp. 825-828, of the present volume.

†American Steel & Wire Co.

NOTE—The headpiece shows the conveyor road of the Lion Coal Co., Wattis, Utah, as seen from the tipple. The rope is about 10,000 ft. long.

strands in the rope are twisted in opposing directions. The result of that method of manufacture is a tendency in the rope of regular lay to hold itself together and particularly to resist any force tending to untwist it. The action which would take place in a regular lay rope, when subjected to a force tending to untwist it, would be to cause wires in the strands to twist up tighter, thus creating a powerful reaction against too much untwisting.

In the Lang-lay rope, however, under the same conditions, an untwisting of the rope proper will cause an untwisting of the strands and loosening up of the wires, the only force tending to prevent the rope from completely untwisting being the natural stiffness of each wire taken by itself. Compare this with the tendency of a regular-lay rope which is to react as a whole and powerfully to stop the untwisting.

ROPE HAULING CARS TO TIPPLE

Another view of Lang Coal Co.'s rope haulage road with mules in road.

Installations which have used Lang-lay ropes and reported unfavorably on them have done so in many cases owing to the natural reaction against innovation that takes place when the Lang-lay rope is put in service. It should be noted that whereas in the United States probably 90 per cent of the ropes used are of regular lay, in England, Continental Europe and South Africa by far the greater percentage of the mining ropes are of Lang-lay construction. Had the difficulties in the use of Lang-lay ropes been insurmountable their use would not have been so general in those countries.

In a Lang-lay rope the worn spot on each wire is longer than it is in a rope of regular lay. The Lang-lay rope usually is at least 5 per cent stronger than a regular-lay rope composed of wire of the same size and strength. This is an advantage that has sometimes been overlooked by those who have criticized the former. Another criticism that has been offered is that it is more difficult to splice. This, I think, is a fact that is granted by the manufacturers and users. It is not, however, an insurmountable difficulty, as has been proved by the use in various places of what is known as flattened-strand hoisting and haulage rope. All of this rope is of the Lang-lay type, and not only can be, but has been, spliced successfully, and found to give admirable service.

The particular place where it is advisable to use Lang-lay rope is on gravity inclines and slopes where the rope rubs or drags. It may also be used on vertical shafts, although few such installations are found in the United States. In Canada most of the shaft ropes in use are of Lang-lay construction, due largely probably to the influence of Great Britain in furnishing ropes of this section. Lang-lay ropes on shafts have, so far as observation goes, given good results and little trouble. In general, a Lang-lay rope should not be used with swivel connections, as it tends to untwist.

Ropes composed of round strands differ greatly in their flexibility. Listed in the order of their increase in that quality are the following constructions:

TABLE I—ROPE ARRANGED ACCORDING TO FLEXIBILITY

6 strands, 7 wires, 1 hemp core—round-strand rope	least flexible
6 strands, 8 wires, 1 hemp core—flattened-strand rope	
6 strands, 19 wires, 1 hemp core—round-strand hoisting rope	
6 strands, 25 wires, 1 hemp core—flattened-strand hoisting rope	flexible
18 strands, 7 wires, 1 hemp core—non-spinning hoisting rope	
6 strands, 19 wires, 1 hemp core—extra-flexible hoisting rope	very
6 strands, 37 wires, 1 hemp core—special flexible hoisting rope	flexible

Flexibility is increased by increasing the number of wires in the strand and decreasing the diameter of the individual wires. Whenever, therefore, the flexibility is decreased, the wearing surface also is decreased and the wires will not stand as much abrasion as those where a coarser construction has been adopted. Were it not for this fact, any place requiring a flexible rope could have its requirements fully met regardless of the other conditions.

Rope consisting of 6 strands of 7 wires, of course, is rather stiff and is used only for mine haulage and similar uses. The same is true of flattened-strand rope, 6 strands of 8 wires. The rope of 6 strands, 19 wires, as modified is used for both mine hoists and haulages, as is also the 6 strands, 25 wires, flattened-strand hoisting rope. In the case of haulages, rope something like the Seale patent construction of 19 wires is used, and in the case of shafts the regular 19-wire strand rope is used.

Use Many-Strand Rope If Guides Are Lacking

Rope of 18 strands, 7 wires each, known as non-spinning rope, is used in mining operations almost wholly for shaft sinking, for when it is used a shaft can be sunk without guides, the bucket showing no tendency to rotate when being hoisted. This rope, of course, is specially constructed for the purpose of attaining this freedom from rotation. It is not a rope that is recommended for promiscuous hoisting purposes, but it is exceedingly efficient in shaft sinking and has demonstrated that it is superior to any other type or construction for that purpose. Ropes composed of 6 strands of 37 wires are seldom used for shaft work, because the flexibility is in most cases greater than is required. Rope of 8 strands, 19 wires is seldom used for shaft work, and for the same reason. Shaft ropes, which are overlaid in winding on the drum, are made of modified constructions containing coarser wires.

During the process of making the manufacturer should lubricate the rope internally and externally. It can be done better and more thoroughly then than at any other time. Additional lubricant should be applied as soon as the rope shows external signs that such attention is needed either to reduce friction or to prevent rust. In making the application it is preferable to put on a small quantity frequently than a larger quantity at longer intervals. Be sure the rope is free from water, for if it is present it will prevent the lubricant from adhering.

Most lubricants are free from acid, but if in doubt, a test for acidity should be made. Acid will cause the steel wire to become brittle. Whenever possible, a can of lubricant should be placed so that it will drop from a point on the rope as it runs back and forth. This will be found to lubricate the rope effectively and at a low cost. With the drip method, a thinner lubricant may be used than where the lubrication is more complete but is done only periodically. Many lubricants must be heated before application, and in the winter it is

more difficult, of course, to lubricate a rope than in the summer.

A wire rope wears out gradually in service until the time comes when replacement is deemed necessary. When ropes are used for hoisting men, it is usual to remove ropes earlier than when ore or rock alone is hoisted. The evidences which are allowed to govern in the decision as to the time when a rope should be rejected are as follows:

(1) External wear on the wires.
(2) Breakage of individual wires.
(3) Corrosion due to mine water or electrolysis.
(4) Torsion or breakage of wires near attachments.

External wear alone seldom is sufficient of itself to necessitate the removal of a rope, but broken wires are always looked upon as more or less of a source of danger. Corrosion, if internal, is not as noticeable as the other two, but it is really more dangerous than either, being concealed in many cases. Torsion or breakage of wires near attachments is caused by a crowding ahead of the twist or lay of a rope as the hoists are made, coupled with the vibration of the rope which comes to a stop at or near to the drum. This makes it advisable to cut off a short piece of rope from the cage end at regular intervals of time, thus changing the point where the vibration of the rope localizes.

In this connection reference should be made to Bulletin No. 75 of the U. S. Bureau of Mines, where further particulars are given as to practice in the recapping of the ropes on mine hoists. A similar practice is in use in the mining field of the Transvaal.

What Deterioration in Rope Is Fatal

In passing judgment as to whether a rope should be replaced care should be taken to see that all evidences of weakness are given due consideration. A rope showing only wear will be but little reduced in its ultimate strength, much less than the wear would appear to indicate, for the worn spots on the wire reduce the cross-section of the rope but little, and after all it is the cross-sectional area at any given point which determines the strength.

The location and distribution of the broken wires in a worn rope also should be given consideration. Single wires broken in any strand, if separated by a distance of, say, 3 ft. will reduce the strength by only 1/114 if the hoisting rope is composed of 6 strands of 19 wires each. Several wires broken in one spot, however, will reduce the rope strength materially.

In determining the life of a hoisting rope different methods are used to keep a record of the service obtained. Sometimes this is measured by the time the rope is in service, but if the rope is not worked steadily for the entire period, this can at best be only a partial criterion of rope performance. More often a record is kept of the tons hoisted to the surface, including the rock and ore. If this value is sufficiently high, the rope service is considered satisfactory. A rough check of this can be obtained by taking the number of trips made during the rope life.

For elevator work it is becoming more and more common to measure the service by the number of miles traveled by any set of ropes, and it is practicable to do the same with the hoist of a mine shaft by attaching a counter to the drum shaft with suitable reduction gears by which the mileage can be mechanically determined. Whatever method is used for keeping track of rope performance, allowance will always have to be made for contingencies or variations in service.

WHERE ROAD UNDERMINES THE ROCK FACE

To reduce rubbing of rope on rails and roadbed, the road is made as straight as can be arranged. A rocky point that seems to have turned the valley makes it impossible to keep the road on a straight line.

There is still much of what might be termed "conservatism" when it comes to a discussion of the best means of fastening a cage to the end of a wire rope. Men still tend to cling to the older forms of attachment instead of adopting improved methods. I am convinced that this is because many rope users have perhaps never seen ropes tested and feel that in making a change to some other method than that which has been in use for a period of years involves a responsibility which they do not desire to assume.

Most of the general types of rope fastenings have been in use for many years. They are described in Table II, where their efficiencies are given as compared with that of a steel socket with a properly placed zinc filling, rated as 100 per cent.

TABLE II—ROPE FASTENINGS AND THEIR RELATIVE EFFICIENCIES

	Per Cent
1—Wire-rope clamps and thimble	75–80
2—Wire-rope clips and thimble	80–85
3—Thimble or eye splice	90
4—Open or closed steel sockets	100

For clips, the following table should be used in making attachments to the ends of a rope.

TABLE III—NUMBER AND SIZE OF CLIPS FOR ROPES OF VARIOUS SIZES

Dia. of Rope, In.	No. of Clips Recommended	Size of Clips, In.	Max. No. of Wires to Turn Through Clips	Min. Spacing Between Clips, In.
1	2	1	6	6
7/8	2	1	6	6
3/4	2	1	6	6
5/8	2	1	6	6
1/2	2	1	12	5
1	3	1	12	5
1	3	1	12	5
1	4	1	18	6
1	4	1	18	7
1	5	1	18	7
1	5	1	18	8
1	6	1	18	9
1	6	1	18	9
1	6	1	18	10
1	6	1	18	10
1	6	1	18	10
2	6	1	18	10
2	6	1	24	12
2	6	1	24	12
2	6	1	24	12
3	6	1	18	12

With either clamps or clips it is necessary after the load is placed on a rope to go over all the bolts and tighten the nuts, because tension on a rope compresses the hemp center and releases the stress on the bolts, making them unsafe. One reason for using several clamps or clips is to keep down to a reasonable value the pressure necessary to make them hold.

No fastening except the socket filled with zinc will develop maximum efficiency. This method has been

used since 1908 in all of our tests and with uniformly successful results. Thousands of sockets all over the United States have been so attached without a single failure. This form of fastening has been recommended by the U. S. Bureau of Mines and by the wire-rope manufacturers. It is simple, strong and compact. It can be made quickly and easily with the facilities available at any mine. The strongest fastening is none too good where safety of human beings is at stake.

In attaching rope to a drum it is customary to use a hole through the drum and to carry the rope around a spoke or the central shaft and fasten the end back with wire-rope clips. Several laps of rope should be left on the drum when the rope is out at its point of maximum travel, to prevent undue pull on the drum fastening. While this method of attachment is somewhat crude, its use is almost general and little if any trouble comes from it.

In installing a rope it always is advisable to run the rope out its full length, whether it is to work in a shaft or a slope, and let any tendency to untwist run out before it is attached to car or cage. Then several trips should be made, and the rope again disconnected. If this is done the tendency to kink which is sometimes found in new ropes will be avoided. It is essential to do this on both vertical shafts and slopes as it will insure better operation and prevent the occurrence of trouble later.

The Frugal Man Saves Oil Without Injuring His Machinery

By F. C. Sinback

Utah Grove, Ala.

LACK of proper lubrication doubtless is the cause of most of the trouble experienced in the operation of coal-mine machinery. By this I do not mean that enough oil and grease are not applied. On the contrary, I find in a large number of cases that twice or three times as much oil is being used as would lubricate the machinery properly, yet the machines are constantly suffering from a lack of lubrication.

This, for several reasons. First, the oil or grease does not reach the bearing or part to be lubricated, the oil holes and channels being full of coal dust or dirt; second, the oil or grease is not applied at the proper time; third, the lubricant employed is not of a quality suitable for the particular type of machine or bearing on which it is used.

For the lubrication of tipple and washing machinery common black oil is good enough. The oiler, however, should be instructed in its use if any economy is to be shown. He should be provided with wires of several gages so that he can clean out the oil holes, and before applying any oil he should see that all such holes are clean right down to the shaft bearing. He should then use only enough oil at any one time to lubricate the bearing, as any surplus that runs off lubricates nothing and only makes a mess.

The first oiling in the morning should be done before starting up, and the oil should be applied hot so that it will flow freely into the bearing and furnish lubrication the moment a start is made. I have known of several instances where those in charge did not insist that bearings be oiled before starting but instead preferred to wait an hour or more. A bearing will be harmed more in a few minutes of dry running than in a month of steady operation with proper lubrication. For this reason it is always advisable to oil up any kind of machinery before starting in the morning, as some of the bearings may be dry and it does not pay to take a chance.

If grease is to be used on this class of machinery every bearing should be equipped with an approved grease cup of some kind. Furthermore a grease should be selected that will not harden. If spring cups are used they must be watched closely so as to be sure that they are feeding and the oiler should screw each cup down a little, twice or more each day, the first time being before starting up in the morning. All oil and grease should be stored in covered containers from which coal dust, dirt and grit should be carefully excluded.

I find that the slow-running bearings around washery and tipple are neglected more than any others. As they do not run fast enough to produce sufficient heat to be noticeable, they are allowed to become dry and grind themselves out. Oil, it is true, may be slopped all over them but the oil holes are likely to be plugged tight with coal dust and dirt. The oiler of such equipment should be required to keep all deposits of oil, grease and coal dust removed from the bearings, as these are not only unsightly but tend also to conceal the real condition of the machinery.

If motors are used to drive tipple or washery machinery, their bearings should be drained and washed with kerosene or gasoline at least once a month. Only a high-grade oil should be used, and the oil rings should be examined daily to see that they are operating properly. On cold mornings these motor bearings should be watched closely, as the oil is likely to thicken to such an extent that the rings will not operate. In that case the bearings may be damaged before the oil thaws enough to allow the rings to function properly.

All oil drained from motor bearings should be saved and filtered, as it can be used for lubricating other machinery which requires an oil of a comparatively high grade. I use this oil in the power-house oiling system.

A high-grade medium-soft grease, absolutely free from acid, should be selected as a lubricant for ball bearings on locomotives and mining machines. If any acid be present it will pit the highly polished surfaces of the balls and races, and materially shorten their life. Great care should be exercised in keeping grit and dirt out of the grease used in such bearings, as they are ruined quickly by a small quantity of such abrasive material.

On all high-speed bearings of coal-cutting machines I would suggest using a good grade of red engine oil. On the other bearings I would use black oil, except on some of the worm gears, where grease should be employed. The same precautions as to keeping oil holes open and as to the quantity of lubricant used that have been advised in connection with tipple and washery machinery also should be observed on the mining machine. Also the machine always should be oiled before a start is made in the morning.

Before starting to cut any working place the cutter chain should be thoroughly lubricated with black oil. This best can be done by running the chain slowly and pouring the oil onto it at a point where the oil will be carried under the guides. By paying more attention to lubrication the life of machinery will be appreciably lengthened, costly delays will be lessened and a great saving in oil will be shown. A small quantity of oil properly administered will do far more good than a large quantity wastefully used.

Cutting Thin and Pitching Coal Beds in Belgium By Longwall, Using American Chain Machines

Output per Man at Face Has Been Doubled by Change in Methods—No Regular Packwalls Constructed—Stepping of Working Faces Reduced to Five Yards—Foreign Labor on Increase

By F. C. Cornet*
New York City

NOBODY believes that American coal-cutting machines, in their present state of development, can ever be put into successful use in all the Belgian mines, for in some of them the difficulties to be met are extremely unfavorable. Where the pitch of the coal has not exceeded 35 deg., however, the American chain cutter of the so-called longwall type during the last two years has shown such a creditable performance that it is now safe to predict that it will soon be considered an instrument without which the coal in most of the mines of that country cannot be worked at a profit.

In order to understand clearly how the Belgians had to modify their plans so as to make it practicable for them to use mining machines to advantage in their mines it is necessary to describe briefly the mining methods which usually have been adopted in the past in that country, where, according to duly recorded data, coal has been mined for a longer period than in any other country. One of these mining methods, shown in Figs. 1 and 2, consists in driving to the rise, on the full pitch, a series of short faces, *5*, arranged in groups of four to seven—four in the case illustrated.

Each group generally has an aggregate face development of 250 ft. or thereabouts and is driven some distance in advance of the following group. Each face in a given group also is in advance of the following one, but a few feet only. Fig. 1 shows a plan of workings of this kind arranged between two places, *3* and *4*, both driven level in the seam at different elevations and at a relatively considerable horizontal distance from each other. This distance, *L* in the case represented, is 1,100 ft., whereas *H*, the difference in elevation, is 420 ft., making the grade about 38 or 39 per cent.

Place *3* serves as the main road through which all the coal mined between *3* and *4* is hauled away. Place *4* itself was used at an earlier period as a haulage road through which all the coal mined to the rise of that place up to another place of same character driven in the seam at a higher elevation was hauled away. Place *3* is tributary to tunnel *1*, driven across the measures and serving as both air intake and general haulage road.

In the same way, place *4* is tributary to tunnel *2*, also driven across the measures, serving as general return airway and leading to the fan shaft all the air coming from the level of place *3*, not only through the workings

FIG. 2—ELEVATION CROSS TUNNELS AND COAL SEAM
Seam rises about 120 ft. in 1,000, or 11 per cent. The section is taken along Section line 6 of Fig. 1. The long tunnels through solid rock shown here are one of the causes of the high costs of Belgian coal. The cross-section of the tunnels in the coal seam are marked *3* and *4*.

represented but also through all the other workings in operation between the level of tunnel *3* and that of tunnel *4*. There may be a dozen or more such workings.

All places marked *6* are so many self-acting inclined planes through which mine cars are taken from the haulage road *3* to the different faces (5) and vice versa. All these planes are maintained in the gob. Half way between places *3* and *4*, a level place (*6*) is provided in the gob, crossing all the planes of the same group of faces.

Below place *8* only one plane is thereafter maintained, while all the planes above *8* are kept working until all the coal that is tributary to the group of faces has been worked out. Parts of planes when no longer used are allowed to cave. When a group of faces is worked out, all places connected with it also are allowed to cave, as shown by dash lines and indicated by *7* and *8*. All planes, intermediate places (*8*) and the main road (*4*) are double tracked, the gage varying between 22 and 24 in., according to the preference of the company operating the mine. Some cars have a capacity of only 0.33 ton, but some will hold as much as 0.60 ton. This also varies from company to company.

Mining machines tried on the short faces shown in Fig. 1 gave results that were unsatisfactory commercially, on account not only of the shortness of each individual cut, which made it necessary continually to move the machines from place to place, but also and principally on account of the difficulty encountered in moving the machines through the narrow and slate-encumbered passageways provided for the passage of air from face to face and group to group all the way from the lower level

*Consulting engineer.

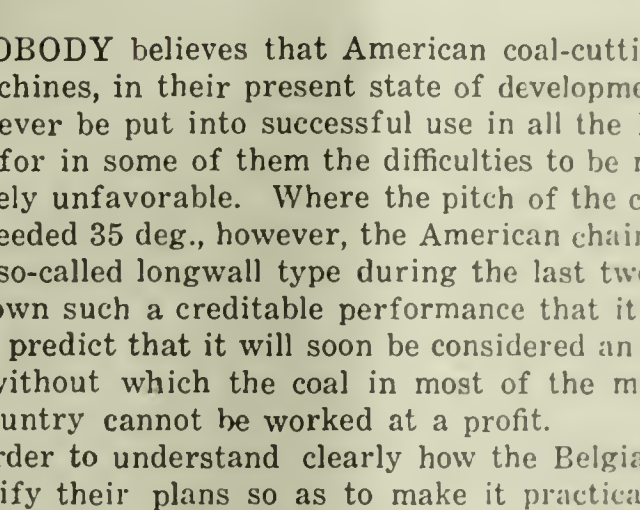

FIG. 1—METHOD OF HAND MINING IN BELGIUM
This plan shows a method that met all requirements more satisfactorily than any other method so long as machines were not used. It is easy to see how the broken face was better suited to hand mining than to machine cutting. The long passageway by which the machines had to be taken from one group of faces to the next was not always as readily negotiable as might be desired and as for moving the machine by way of the self-acting planes that was out of the question.

to the upper one. To move the machines by way of the planes proved well nigh impossible.

Recognizing the impracticability of using cutting machines to any advantage in such workings as shown in Fig. 1, the Belgians turned to the method shown in Figs. 3 and 4. This method, to be sure, was not unknown to them. They had practised it to some extent, and with some degree of success, for many years. But for some reasons, all of which were not fancied, the method never proved nearly as successful as that described above.

These reasons, fancied and real, are of a purely local order. To explain them to readers not accustomed to Belgian mining conditions and customs would be too arduous and long to be undertaken here. Be that as it

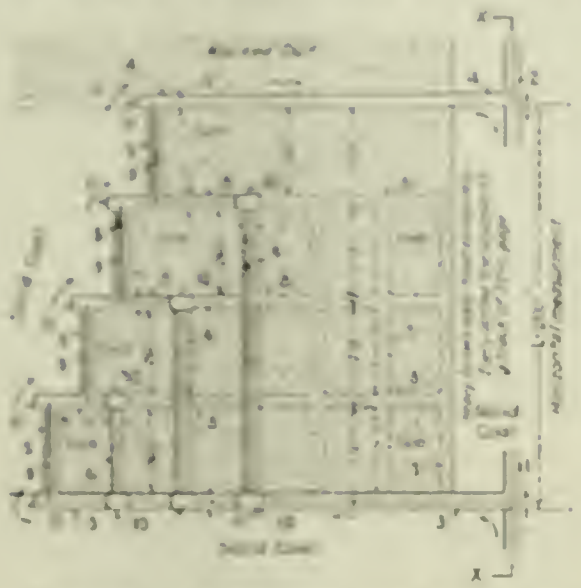

FIG. 3—PLAN AS MODIFIED TO FIT MACHINES

After they adopted machines for cutting the coal Belgian engineers laid out workings of a type that they had formerly rejected. The coal slides down the chute *A* and reaches the gangway *B*, which can be transferred to a self-acting incline at the point marked (*B*). Note that, regardless of their condition, the cars are changed in the manner when it gets back across the face. This same view

may, as soon as the until-then less-favored method was found to be the more adaptable to mining machines, all the drawbacks that had been charged against it were overlooked in an effort to get results with the cutters.

Referring to Figs. 3 and 4, the workings shown are in a seam of the same pitch and general character as are the workings shown in Figs. 1 and 2. The main haulageways, air returns and rock tunnels also are similar. There are here only four faces, all marked 5, each 260 ft. long in horizontal measurement. They lie directly up the pitch and are advanced in the direction of the strike of the seam. Each face is kept ahead of the one immediately above it. Access to the foot of the lowermost face is directly through the haulage road (*3*). Access to the foot of each of the other faces is through a self-acting inclined plane and a corresponding level plane (*6* and *7* respectively), both maintained in the gob and both double-tracked.

Regular point-and-frog switches are not used in this track work. Steel floors (*10*) are laid at all turns, upon which the cars are turned by hand and made to take the track desired. These floors soon become so polished and slick that it takes but little effort to maneuver the cars rapidly as wanted. All these floors require is scraping every morning to remove the material that has hardened upon them during the night.

After scraping they are sprayed with a little black oil, which adds to their slipperiness and gloss. They shine even under the light of the safety lamps, and for that reason are called "polls," which in French means a polished, shining area.

As mining progresses, that is, as the faces advance, the plane serving the uppermost face is in time discontinued and allowed to cave. The next plane is extended upward through the gob to level *8*, serving the uppermost face. In the same way and simultaneously the service of the face second from the top is insured by extending upward through the gob the plane that was serving the face second from the bottom.

The service of the latter is itself insured through a new plane rising from the haulage road (*3*). Belgian miners think no more of driving a place through the gob than our miners of driving a crosscut between rooms. Caved planes and level places, shown in dash lines, are indicated by *7* and *8*, respectively.

As sufficient headroom can never be provided even for mine cars by merely removing the coal the necessary height is obtained by digging into the floor. This is called in French "couper la voie," which means "to cut the roadway." Thus, the cars can be brought to the foot of the different faces at such a level relatively to the floor of the coal seam that the coal, sliding in chutes from along the face, is discharged either directly into the cars, or into small, gate-controlled bins, which in turn are emptied into the cars. When the pitch of the seam is not sufficient to make the chutes operate by gravity, mechanical chutes are used. A system of such chutes was described in *Coal Age* of Sept. 28, 1922. Belgian coal men do not consider that mechanical chutes are necessary so long as the pitch of the seam is 22 deg. or over.

I desire now to call attention to the practice of driving the small recesses (*11*) a few feet (8 to 12) ahead of the faces. The reason for these recesses will appear below. It might be said that place *4* is not properly driving, as it is an old place. But it must be reopened anyway, it having caved since it was first dug and left with nothing but a packwall to maintain it on the upper side.

It will be understood without explanations that the method illustrated in Fig 3 lends itself well to the use of American cutting machines. At one of the Amercoeur mines near Charleroi, where the faces are longer than those shown in Fig. 3, being 88 m., or nearly 290 ft., horizontal measurement, a cut 54 in. deep is completed in 3 hours and 30 minutes, including what time is necessary to change all the bits when the half way point is reached. The Amercoeur pitch is 22 deg.

At the Maurage collieries, where the pitch varies from seam to seam, and even in the same seam, from 10 to

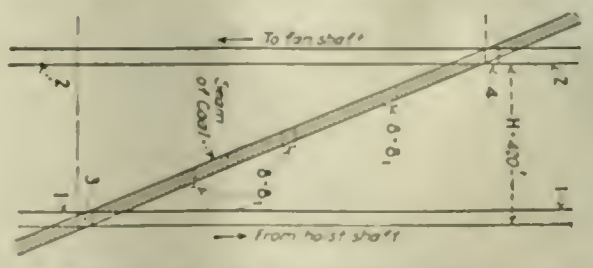

FIG. 4—ELEVATION OF TUNNELS AND COAL SEAM

The cross-section is taken through *X-X* of Fig. 3. It will be noted that the roadways 8-8, do not come out to the line *X-X*, a pillar being left to protect the tunnels from movement of the measures.

25 deg., the coal is cut at the same rate of speed as at Amercoeur, each 250 ft. face being cut 54 in. deep in exactly 3 hours, including the time consumed by a complete change of bits. In the case of the workings shown in Fig. 3 the time necessary for passing the machine from one face to the next varies with the distance separating the faces. It varies also with the condition of

the passageway, which before the arrival of the chain cutter was considered sufficiently large when it answered the purpose of ventilation and a man could pass through it without too much trouble.

Be that as it may, it took less time to pass the machine through this narrow roadway than it does in American room-and-pillar practice to move a cutter from one room to the next one. It must be said also that the adoption of the chain machines has had for immediate results not only to induce the Belgians to keep the passageways freer from obstructions but also to cause them to shorten the distance between faces. From the hundred feet that this distance sometimes was it has been reduced in some cases to 5 yd. The time lost in passing the machine from face to face is now less than 15 minutes.

The probability is that the tendency will be further to reduce the distance between the faces and to make the faces fewer in number. How many these will be will depend only on the maximum number of cars that can be handled at one loading station.

As to the recesses (*11*) mentioned above, they provide convenient places to start or finish a cut. They also are most handy for keeping the machine out of the way when not in use. In an article appearing in *Coal Age*, page 759, Nov. 9, 1922, I have referred to such recesses, calling them "flanking places."

Wherever chain cutters have been adopted in a Belgian colliery, the output per man has been increased at least 90 per cent. In some instances, as at Amercoeur, during January of the present year, which was the record month, the increase in individual output was an even 100 per cent. What is meant by individual output is the figure obtained by dividing the number of tons of machine-mined coal by the total number of men, from assistant mine boss to bit carrier, employed in mining the coal and delivering it on the haulage road, coupled in trips ready to be hauled away.

Coal mined by machines yields also 22 per cent more lump than hand-mined coal, lump being defined as material not passing through a hole 3 in. in diameter. This increase in individual output means much in Belgium, where men tended to become scarce even before the war and have become scarcer since. Polish and Italian miners are now hired in ever-increasing numbers by Belgian operators.

I recently met in Belgium a number of foreign men, women and grown children who had not had time yet to learn how to make themselves understood in French, but with whom I was able to converse pleasantly for the reason that they all spoke pretty good American, having been at some time in the near past employed in American mines, mostly in West Virginia and eastern Kentucky.

In these days when American opinion seems to vary so widely concerning prohibition and the effect it has on the foreign working man, it may be interesting to relate that all these Polish and Italian men and women, especially the women, look forward to the day when they will be lucky enough to land in this country again. When I jokingly mentioned prohibition they shrugged their shoulders and said "What do I care."

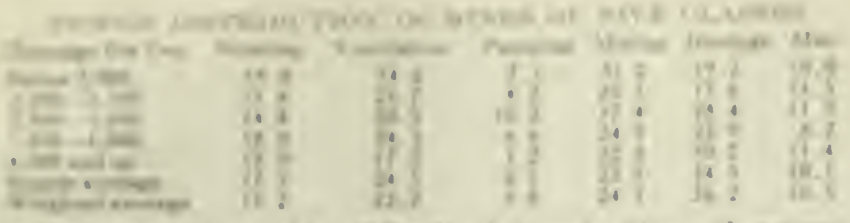
Relation of the Various Mine Power Costs Discussed at Illinois Institute

ONE of the leading articles at the Illinois Mining Institute was that of A. J. Hoskin, research assistant professor of mining engineering at the University of Illinois. Its subject was "The Distribution of Power Consumptions and Costs in Illinois Coal Mining."

In prefacing his paper, Mr. Hoskin said it was obvious that electricity is supplanting all other power underground but that on top "steam has better withstood the competition, although it is certainly yielding. Under some managements, if the airshaft is comparatively near the boiler house, an electric motor has little chance against even a second-hand steam engine for driving a fan. The same idea applies to small power units about the tipples. Though some managements may be strong for electrical units elsewhere, they insist upon the use of live steam for hoisting and ventilation and for driving screens and shop machinery."

In making the investigation into power consumption and costs in Illinois mines Mr. Hoskin assigned all consumption to six items: mining, haulage, hoisting, pumping, ventilation and miscellaneous. He said that as it is unusual for mining companies to subdivide into so many heads, he had much trouble in getting the necessary data. In fact, he said, he was told by many well-informed men that his effort would be fruitless. He made it nevertheless and asked fuller co-operation that his work may bear real fruit.

In his study of distribution he picked fifty shipping shaft mines of various sizes which he thought were typical of the 373 such mines in the state. Their combined daily production is 141,380 tons, varying from 650 to 5,200 tons each. Their depths vary from 101 ft. to 650 ft., the average being 321 ft. The thickness of coal ranges from 3 ft. 6 in. to 10 ft. with an average of 7 ft. 2 in. In 1921 they worked from 181 to 306 days and averaged 207 days.



Mining is manual in 9 mines, by compressed air in 1, and by electricity in the remaining 40 mines or in 80 per cent of the whole. Direct current is used in 38 and alternating current in 2. Haulage varies from "all-mule" to all electric. Hoisting is by steam in 95 per cent of the mines. Pumping is exclusively electric in 25 per cent of them, is performed by steam in 24 per cent and in the rest both electricity and steam are used. Pumping consumes 52 per cent of the total power used in one mine and less than 1 per cent in others, making the pumping average 5 per cent.

Many Fans Are Still Driven by Steam

Steam drives the fans at 38 of the 50 mines. The "miscellaneous" division of power consumption which made up about one-tenth of the total included boiler-surface or boiler-feed pumping, carpenter and machine-shops that serve other mines and the crushing and screening of coal before shipment to washeries.

A table of statistics on power consumption at the 50 mines failed to give basis for any definite general conclusions or any consistent relationship between the six classifications. Hoisting, for instance, ranged from 1.4 per cent to 50.8 per cent, ventilation from 2.2 to 61.3 and haulage from 4.6 to 67.1, thus making plain the fact that "every mine is a problem of itself." Mining, haulage and ventilation showed a consumption of two-thirds of the total.

Dividing Mr. Hoskin's percentage figures on power consumed under the six headings and grouping the 50 mines into 5 groups of 10 mines each, this table results:

In attempting the difficult determination of power costs Mr. Hoskin said he encountered all sorts of obstacles, chief of which was the incompleteness of the records of Illinois mining companies. In most cases, he said, such costs are not distributed to the final consumers of power. A common practice, he said, is to combine haulage and mining as one item.

At mines which purchase power the exact total, of course, is known but hardly any attempt is made to allot it. As to locally generated power, about all the operator knows is the total as recorded on the switchboard. Mr. Hoskin said little is known even of the cost of operating boilers. Data are as difficult to get from steam mines as from any other.

Because of the difference in the value of coal and because of various other items, Mr. Hoskin said it seems almost impossible to arrive at any common and comparable system for figuring power costs at different mines. Some superintendents say they burn non-salable coal that has no market value and therefore cannot be charged against power.

Others, in attempts to fix their charges fairly, figure them on the mine-run cost of coal for the preceding month, a few burn whatever grade of coal gives best efficiency and charge it at the prevailing market price, and some strike an average for a whole year from the 12-month average, thus putting themselves on the same "annual contract" basis as most big consumers.

Then there always is the question, "Should we charge at market rates or at the production-cost level?" Whatever the system followed, Mr. Hoskin believes 75 per cent of the power cost is boiler-room expense. He asked his hearers for assistance in determining some fair basis for figuring these costs, so vital to the coal-mining industry.

In a written discussion of the paper, Carl W. Lee, engineer of the Peabody Coal Co., proposed that power for all uses be reduced to kilowatt-hour per ton basis and suggested some subdivisions of uses that would make cost determination easier. He thought coal should be figured at a final average cost per month. F. F. Jorgensen, general superintendent and chief engineer for the Superior Coal Co., at Gillespie, Ill., said the average market value for the year is a good basis for all except industrial mines, where this average must be assumed, as the coal is not marketed.

Another speaker called attention to the facts that power consumption is directly affected by which of the various hoisting methods was adopted, by the condition of the track and haulage equipment, by the age and condition of the fans, by errors in pumping, such as permitting pumps to "run on wind," and by power losses in transmission, all of these adding elements that would have to be considered in figuring power costs.

J. C. Quade, chief engineer for Big Creek Coals, Inc., said his company's six mines, operating under widely varied conditions, find the kilowatt-hour or the horsepower-hour the best basis. E. G. Lewis, of Sandoval, and J. H. Hoskins, of Danville, both agreed that the actual production cost, not market price, should be the basis. D. D. Wilcox, general superintendent of the Superior Coal Co., pointed out that on account of the variation in value of coal between mines, price is not a fair basis, but some basis of fuel value is.

F. W. DeWolf, chief of the State Geological Survey, followed this by suggesting that the British thermal unit basis be adopted. Mr. Hoskin ended the discussion by asking again that the coal men of the state help him to find the answer to the vexed question and said that if they gave him the efficiencies at points of consumption and helped him arrive at a fair basis for fixing the value of coal, they would be performing a real service to the industry.

Mr. Quade described by word and picture the new No. 4 mine of his company—Big Creek Coals, Inc.—west of Harrisburg. It is calculated to become a 5,000 tonner, though now it is hoisting only through the airshaft. The main entry is driven through from shaft to shaft and development work is going steadily ahead. The concrete work in shafts and bottoms struck the institute as being particularly striking and handsome. Some of the underground pictures shown with slides made the mine look more like a monastery than a coal pit.

Harold E. Culver, who is working under the co-operative agreement of university, state and government, spoke interestingly on the work he is doing toward identifying more accurately the various seams of coal of Illinois, suggesting that it is entirely possible that the seams the mining men know so well might possibly be correlated as between fields. The usual earmarks such as distances of a seam from the surface, thickness and nature of roof, solidity of floor, appearance of "blue bands" and the like may not be infallible. The fossil shells and plants in the caprock on No. 6 seam are found in varying thicknesses of rock and in rock that does not overlay any coal at all. Thus they may not be true indexes of specific coal beds.

He said he had been trying to find the answer in the sequence in which various strata were laid down. The biggest difficulty in the way of this determination, he said, is the fact that limestone, shale and sandstone were laid down in different places at the same time. One or the other may lie directly on top of a given seam of coal in different parts of even a single county. It is necessary to know the conditions under which each was laid, whether under sea, at the water's edge or inland by streams. This is a complicated question. Mr. Culver said he hoped the operating men of the state would give him all the data available when he asks for it, which will be on occasions both soon and frequent.

THE U. S. BUREAU OF MINES and the Public Health Service, cognizant of the importance of dust in the causation of pulmonary disease, have conducted numerous studies on the quantity and nature of dust in mine and factory air. A new instrument for sampling aerial dust devised by Leonard Greenburg, assistant sanitary engineer, retired, U. S. Public Health Service, and George W. Smith, junior physical chemist, Bureau of Mines, makes use of the principle of impingement of the dust-laden air at high velocity on a wetted glass surface together with that of bubbling the air through a liquid medium. This apparatus consists essentially of three parts: a hand pump or electrically driven blower, a flow meter, or other suitable means of measuring the air passed through the instrument, and the dust-collecting device. A description of this new dust sampling instrument is given in Serial 2,392, which may be obtained from the Bureau of Mines, Washington, D. C.

Insulating Oils Are Decomposed by Passage of Current: How to Keep and Restore Their Dielectric Strength

Heat Raises an Oil Vapor but Disruptive Discharge Releases Hydrogen—Sludge Is Formed by Oxidation of Overheated Oil —One Part of Water in 50,000 Will Render Oil Unfit for Use

By E. J. Gealey
Kingston, Pa.

TRANSFORMER oil, using the word in its larger sense, covers the oil used not only in transformers but in oil switches, lightning arresters and feeder regulators. It is used for many purposes, insulation being among the more important. This it may effect directly or by its action in excluding moisture. It is circulated through windings for the purpose of carrying away the heat generated therein. It serves also as a preservative and as a means of extinguishing arcs.

Tranformer oil is a product of mineral oil and is a member of that hydrocarbon group which begins with methane or marsh gas (CH_4) and includes a long series of compounds of increasing molecular weight, the members of the group containing gases, liquids and solids. Kerosene and gasoline are representative of the lighter oils while lubricants and transformer oils are exemplars of those that are heavier. The solid members of the group are paraffin and its analogues.

As the molecular structure is changed, the specific gravity, the specific heat, the viscosity, the volatility, the dielectric strength and other properties are changed, as also the relative flash and fire points, the insulating and cooling qualities.

As hydrocarbons are inflammable under certain conditions of temperature, pressure, air admixture and ignition, their use must be safeguarded. Fortunately these conditions are so rarely obtained in combination that in most instances the hazards involved in the use of the heavier oils are quite negligible.

Distillation vs. Dissociation Products

When the gases formed as a result of this disintegration are analyzed it is found that hydrogen preponderates and that there is a relatively small quantity of hydrocarbons. In view of the violence with which oxygen and hydrogen unite even when the former is only in such concentrations as are found under ordinary atmospheric conditions, it is easy to understand how great a destructive force can readily be obtained from the ignition of an atmosphere of air and decomposed oil.

On the passage of a disruptive discharge hydrocarbons form gases, at or below the oil surface, that differ radically from the oil vapor that is formed as the result of a gradual increase in the temperature of the oil. The accumulation of oil vapor that forms the basis of the flash-point test is still essentially one of oil and consequently the vapors will condense when the temperature is decreased, resuming their original character. On the other hand, the gases resulting from the disintegration of the oil molecules consequent on disruptive discharge are permanent over ordinary temperature ranges. These facts are not generally appreciated.

Though the explosion of a mixture of air and disintegrated oil is more destructive than a mixture of air and oil vapor, it has proved to be of rare occurrence, and when it happens it is usually traceable to some neglect.

A good transformer oil for general purposes should have the following characteristics, viz: a high dielectric strength, a high flash point, a high burning point, a low freezing point, low viscosity (when measured in the time in seconds required for a given quantity of oil to pass through a standard orifice at a definite temperature), a minimum tendency to form a sludge and a freedom from acid, alkali, sulphur, wax, animal or vegetable oils or fats, or other soluble matter.

The great enemy to transformer oil is water. The deleterious effect of small quantities of moisture on the dielectric strength of oil is now recognized by nearly all who use it, but it appears to be even more serious than is generally supposed. Fig. 1 shows clearly the effect of moisture on the dielectric strength of oil.

For high-tension work the classification in Table I is sometimes used in comparing oil.

TABLE I—DIELECTRIC STRENGTHS OF TRANSFORMER OILS

0 kv. to 15 kv.	Unsatisfactory
15.0 kv. to 17.5 kv.	Doubtful
17.5 kv. to 20.0 kv.	Satisfactory
20.0 kv. to 22.5 kv.	Good
22.5 kv. to 25.0 kv.	Excellent

Owing to the confusion which has arisen from the use of different standards it may be necessary to add that Table I is for use with the so-called new-style test gap. The old-style gap was made of electrodes having a ½-in. face and set 0.2 in. apart, the new-style

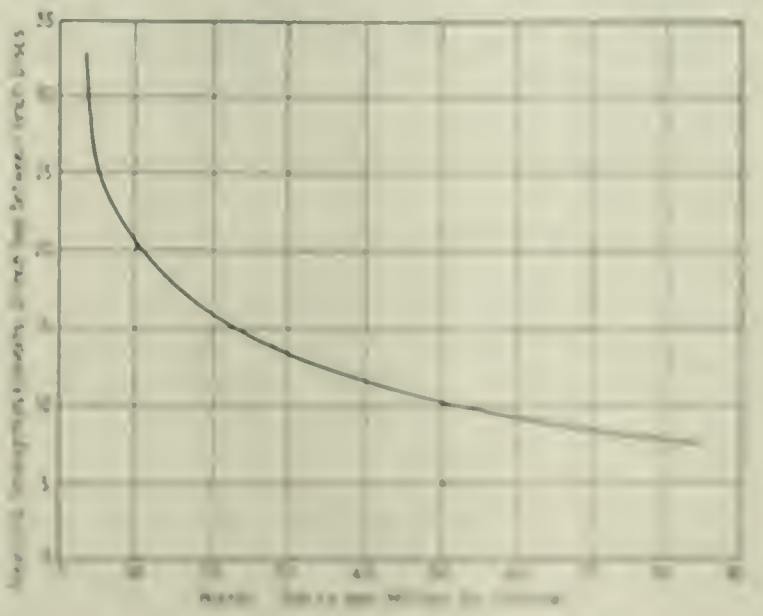


FIG. 1—CHART SHOWING HOW RAPIDLY DIELECTRIC STRENGTH INCREASES WITH REMOVAL FROM WATER

Insulating oils are unaffected and their strength is not impaired by the presence of water, but moisture lowers the dielectric strength, and sometimes to the point of danger. Even when in the oil only in solution, water condensed out by the cooling of the oil in a transformer reduces the dielectric strength to a dangerous degree.

It is, therefore, important that oil be kept in its original condition, as it is quite possible to get a transformer oil of the best grade and yet have trouble if the oil is not given the proper care.

All oil in unsealed drums and even all oil in drums that are sealed but which have been stored where they were exposed to the weather should be tested before using by taking a sample from each drum. Drums stored out of doors always should be placed on their sides, never turned up on end. The chimes should never be allowed to lie in pools of water, nor should water be allowed on the heads when the drums are in a vertical position. Outdoors storage of oil always is hazardous and to be avoided if possible. When drums are stored out of doors they should be protected against direct precipitation of rain or snow.

Extreme precautions are required to insure that containers used for transferring oil be clean and dry. A drum of cold oil when taken into a warm room will "sweat" and the moisture thus formed may mix with the oil when drawing it from the drum.

To filter out some of the scale formed inside a drum of oil the oil should be first slightly heated and filtered through about two or three layers of ordinary finely woven cotton cambric that has been thoroughly washed and dried. It is highly desirable that all the remaining scale be taken from the oil by a suitable filtering machine.

Periodic inspection and tests should be made to determine the quality of transformer oil. These tests will determine the necessity for dehydrating and purifying the oil if it has absorbed moisture or acquired sediment.

Large users of transformer oil are becoming more and more converted to the necessity of taking these precautions. Where this practice has been followed in a systematic manner it has been found that failure of apparatus from burnouts, and "unknown causes," with subsequent interruption of service, has been reduced to a minimum and a resulting economy in the use of oil has been effected.

In Testing Choose Worst Oil in Transformer

The oil used for inspection and test should be taken from the lowest point in a transformer tank so that any sediment or moisture in the oil will show up in the sample. The sample should preferably be taken after one or two bucketfuls of oil have been drawn off the tank.

In the commercial testing of oil, small flat disks with sharp edges usually are employed as electrodes, so as to combine uniformity of field with edge effect.

Fig. 2 shows an oil-testing cup. The gap is locked in position after being set against a feeler gage. The cup is made of a composition, usually of hard rubber. The interior of the spark gap is perfectly smooth and symmetrical so that there is no tendency for dirt to collect. When the spark gap is used on the testing transformer it is supported and insulated by the high-voltage terminals.

The testing transformer usually has a ratio of 110 to 25,000 volts. The control consists of an air-cooled auto-transformer with regulating taps, connected to a selector switch. Dial contacts are arranged to give 15, 17.5, 20, 22.5 and 25 kv. on the high-tension winding of the transformer.

When making a test of an oil the cup is first thoroughly cleaned, usually with benzine, and then washed out with a small quantity of the oil that is to be tested.

The gap having been accurately set, a sample of the oil is put in the cup and allowed a short time to settle; the voltage is then applied to the electrodes of the test gap and gradually raised until the gap breaks down or the oil takes the full 25-kv. test.

After each discharge it is essential that the test cup and electrodes be washed free of any carbon or other foreign material. The disruptive breakdown of oil under dielectric stress is not due entirely to the voltage exceeding the dielectric strength of the oil, as is the case with air, but is due to some extent to something being carried into the dielectric field or being produced in that field which weakens the dielectric strength so as to cause a premature breakdown.

This material may be particles of moisture, dissociation products of the oil, olefines, fats, fatty acids, dust fibers or combinations of them, in solution or colloidal solution or suspension in the oil. For this reason it is always best not to disturb too greatly the sample under test before applying the voltage test.

A small bright spark may pass across the gap without causing the testing circuit to open. When this occurs this discharge should not be regarded in recording the results of the test because it usually is due to minute air bubbles which have not had time to escape from the sample after being poured into the test cup.

The dehydration and purification of transformer oil may be accomplished by either the filtration or the centrifugal method. In the first the oil is pumped under pressure through a filter press consisting of several layers of dry blotting paper. The solid matter in the oil is caught by the paper, and the water is retained by capillary action. The capillary attraction between the paper and water is greater than that between the paper and the oil. The effectiveness of the method is dependent mainly upon this fact.

The other method consists of pumping the oil into a machine where after heating and delivery to the top of the purifier it flows into a revolving bowl. Here it is dehydrated and purified. Both methods may be used when the transformer is in operation. The best results will be obtained by following the instructions of the manufacturer of the machine.

The successful operation of transformers, oil switches, lightning arresters and feeder regulators, therefore, depends to a large degree upon the condition of the oil, which should be systematically inspected at least twice a year. Low-tension equipment does not necessarily require an oil with high dielectric strength, but as a very small quantity of moisture will seriously lower the dielectric strength of the oil, the best method to pursue is to keep the oil up to standard test, namely, 22 kv. new-style gap.

It is also to be remembered that the oil level always should be maintained so as to prevent flashes above the oil surface and the consequent disasters which may occur, and special care should be taken to have no condition which will decompose the oil and form highly explosive mixtures above its surface. It is undoubtedly this latter condition which has caused lightning arresters and switches to blow up, thus initiating severe fires.

The following are the approximate characteristics which oils for specific purposes should possess. They may be used as a guide in the selection of transformer oils.

For use in aluminum-cell lightning arresters, starting compensators and oil circuit breakers not subjected to

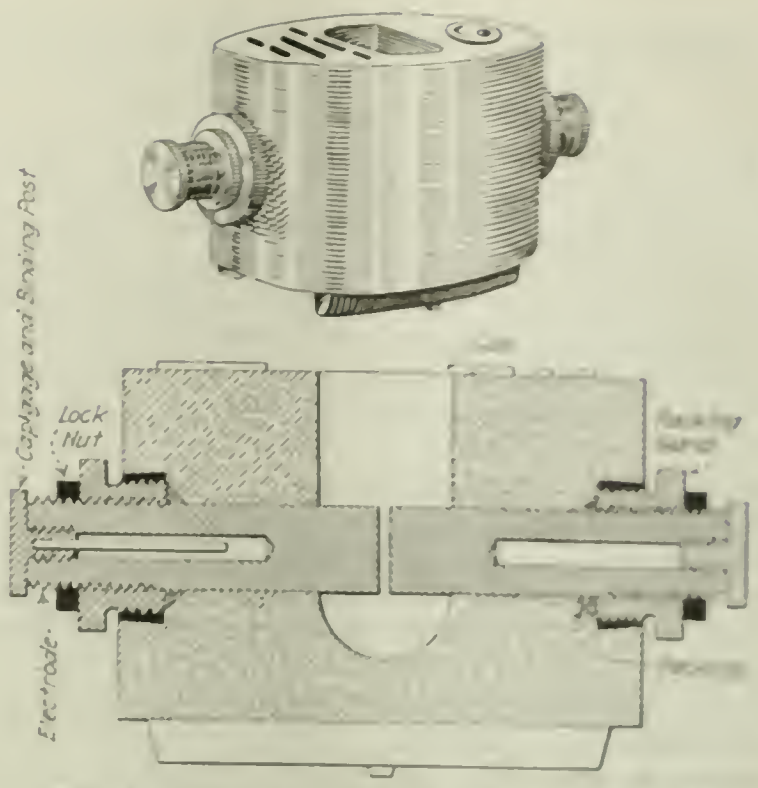

FIG. 2—TESTING CUP FOR INSULATING OIL

This cup is held by the terminals of a transformer which is under the cup and forms an integral part of the equipment.

temperatures below 0 deg. C.: Flash point, 185 deg. C.; burning point, 210 deg. C.; freezing point, —10 deg. C.; viscosity at 40 deg. C., 105 sec.

For oil-cooled, water-cooled and combination oil- and water-cooled transformers, also for feeder voltage regulators, except for outdoor installation in cold climates: Flash point, 140 deg. C.; burning point, 155 deg. C.; freezing point, —5 deg. C.; viscosity at 40 deg. C., 52 sec.

For outdoor oil circuit breakers when subjected to temperatures below 0 deg. C., also for the dashpots of time-limit attachments: Flash point, 155 deg. C.; burning point, 180 deg. C.; freezing point, —30 deg. C.; viscosity at 40 deg. C., 100 sec.

THE UNITED STATES contains 12,000 square miles of unused peat land, an area more than 10 times that of Rhode Island, capable of yielding fourteen billion tons of fuel at a cost of $1.50 to $5 a ton, according to a comprehensive bulletin on the subject just issued by the U. S. Geological Survey. The deposits are on the surface and lie in the New England, Atlantic Coast and Great Lakes states, most of them in regions remote from coal mines. This bulletin, which is the most exhaustive American work on peat and required two years for its preparation, points out the location of thousands of deposits, owned by thousands of farmers and other landowners. Fifty million tons of peat is used annually as fuel in Europe. Peat is suitable also for use as a fertilizer and in promoting the intensive growth of truck crops, both in greenhouses and in open fields. Those interested in peat may obtain free copies of the bulletin by addressing the U. S. Geological Survey, Washington, D. C. It was prepared by C. C. Dobbs and is published as the Geological Survey's Bulletin 728, entitled "The Occurrence and Uses of Peat in the United States."

LIKE THE EASTERN INTERIOR STATES as a whole, of which it forms a part, the western Kentucky field produces railroad fuels chiefly, states the Bureau of Mines, in a recently issued paper on Kentucky coals. 80 to 85 per cent of the entire output of the district being used by railroads, a proportion somewhat above that for all bituminous coal mines in the United States. Little coal from western Kentucky is sold for the manufacture of gas, although about 12 per cent of it is taken by electric light and power companies. The district produces also a lump coal that finds a wide market for domestic use, and about one-fourth of the output is shipped to retail dealers. A little coking coal is produced

Something Like This May Be Happening In Your Mine, Right Now!

O. K. BROWN, the clear-cut, efficient general manager of the Harmless Fuel Co., with mines at Normal, North Mississippi, after having read with a good deal of interest, the printed matter sent out by a well-known manufacturer of mining machinery, exploiting an improved mine-car loader, decided that mechanical loading was the proper thing for his otherwise up-to-date mine, and ordered one of the machines for trial.

Prior to the advent of the loader, Mr. Brown visited his mine, and after talking over matters in general with Mike, the pit boss, as soon as he dared do so, sprung the news on that skeptical individual that he had purchased a mine-car loader. This statement immediately met with a storm of protests from Mike—he didn't want it, it was no good; they had used one over at Hardcut and chucked it on the gob.

However, Mr. Brown insisted that they must be up to date and use mechanical contrivances wherever possible, and insisted that Mike take the loader into the mine and give it a fair trial. After which Mr. Brown went upon his way and forgot the matter for the time being.

Enters then, the mine-car loader, which Mike promptly has unloaded from the car and stored outside the mine, where it can be cleaned by every rainstorm and where the wind can blow the dust off of it. There it rests for two weeks, after which time Mike condescends to place it in the mine for a "fair trial," being induced to do so by the receipt of several letters from the general office inquiring as to what progress has been made with the machine, also due to the fact that they had run into a fault over in 10th left, where there was about 3 ft. of rock and 2 ft. of coal, and this entry was getting away behind. Here, they decided, would be a good place to try the thing out.

The manufacturing company sent down a demonstrator and after several vexatious delays Mike gave him an electric drill with which to drill the rock, and some powder and a couple of men—one a Mexican who could not speak a word of English and the other a Hungarian by the name of Grabeski—and told them to go to it. Grabeski took to the loader like a duck to water, and thought it was great; said that if he had had that loader before it would have saved ten years of his life, as it was so much easier to load on to the end of the conveyor than to lift the material into a car—especially the slate. The Mexican, being unable to express himself, naturally said nothing, but did about as much work as one would expect from one of his race.

And so, under these conditions, the demonstrator tackled the job of making a hit with the loader and incidentally with his own company. Drilling the rock was hard and slow work, the shooting was a serious handicap, as they were away ahead of the air and had to wait a long time for the powder smoke to clear away. The cars (especially those loaded with stone) were too heavy to push the 300 ft., which unfortunately was on a steep grade against the load, and as Mike could not spare a mule the demonstrator went to the nearest town and bought 600 ft. of Manila rope and a snatch block, and by means of the capstans on the loading machine he managed to handle his cars against the grade. But in spite of this, had the car supply kept up, a favorable showing could have been made, but there were heart-breaking intervals between cars, when the machine would remain absolutely idle for long periods of time. A day or two later Mike wrote the home office about as follows:

> The mine-car loader was put to work in 10th left last Monday, but it ain't doing much good. It has been given a fair show as it gets its turn of cars every time with the rest of the men, and I gave it some advantage because I gave the machine crew a power drill, while the crew that is loading by hand on a parallel entry is drilling by hand, but then again the crew on the loading machine has to push their cars about 300 ft. to the motor, and the other crew does not have to push the cars so far.

At this stage of the game the demonstrator had a little heart-to-heart talk with Mike, telling him that he must have more cars, because he was idle most of the time and didn't have anything to load his coal in. Mike insisted that he was getting "as many cars as he was entitled to" and that the "machine was installed with the understanding that it would be successful in their system of mining, and with their system everybody had to take his cars as they came—they couldn't favor anybody."

The loading machine kept on working under this alleged "system" for two or three weeks, when the demonstrator finally managed to get hold of extra cars occasionally, so that it was not long before he caught up with the 11th left.

In the interim Mike bombarded the general office with reports giving the number of tons of coal handled by the pit car loader per week, and how many tons the crew on the other entry had loaded (in clean coal—not mentioned in the report). The coal company's general office, studying these paper statistics, figured the cost of both entries according to the scale, and reported back to the makers of the loader that the coal cost much more when loaded by the machine than when loaded by hand.

Thereupon the manufacturers wrote their demonstrator and asked him "How come?" He explained the matter, and the general office went after Michael once more, but that equitable gentleman could not see but that he was giving the loading machine a "fair trial" and grew somewhat peeved at the demonstrator for insinuating that he was not getting a fair show; whereupon the demonstrator arose and spake about as follows:

"Look'y here, Mike; suppose, for instance, that you had never had mechanical haulage in this mine, and they sent down an electric locomotive for you to try out, and you handed the locomotive the same deal as you give me, and, for instance, give the locomotive a car of coal to haul, and give a mule a car of coal to haul, and the

WHAT KIND OF A CAR ALLOTMENT WOULD HAVE BEEN HAD IT BEEN PACED BY A MULE AND GIVEN ONLY A MULE'S CAR ALLOTMENT?

mule gets away first. Of course, as the mule is in front of the locomotive, the locomotive cannot make any better speed than the mule, and as it cannot jump over the mule, it arrives at the bottom after the mule does. Of course, when they return with the empties, the locomotive is in the lead, but after they get loaded up, the same state of affairs exists again, and as a result, the locomotive appears to be just about as efficient as one mule. Do you think you would be giving the locomotive a "fair trial" under such circumstances?" But Mike scratched his head and said, "It's different with a loading machine."

In desperation the demonstrator said "Look'y here Mike; you know that the locomotive can go faster than a mule, and admit that at the same time it can haul a whole trip of loaded cars?" "Yes," says Mike. 'You admit that the loading machine can load much faster than can be done by hand?", and Mike admitted that. "If the machine can load cars much faster, it can load a greater number per day, can't it?" and there being no way of getting around this logic, Mike finally admitted that maybe it would be a fair trial if he got some more cars, and then he said that he admitted the conditions were not good for getting a big output of coal.

At the end of the trial period they had not as yet gone through the rock, and Mike rather hated to give up the machine before he got through, as he had trouble in hiring anybody to work under the conditions, and he had to pay such as he did get good day's wages. So he took the matter up with Mr. Brown, and Brown wrote the manufacturers asking for a month's extension of the trial period, stating that while the coal cost more when loaded by the machine than when loaded by hand, they had advanced the entry faster than they did before, and were not ready to condemn the machine, but would like to give it a further trial. The trial period was extended another month.

In the meantime the demonstrator plugged away, driving entry. The rock grew thinner, and more and more cars were needed, but Mike, while he realized now that in order to give the loader a "fair trial" it would be necessary to keep up the supply of cars, was unable to do so, as they had only one locomotive in the mine and this was tied up in handling cars to other parts of the mine; so there were no means of providing cars for the loading machine.

At the end of the further trial period Mike had driven his entry as far as he desired, and consequently the manufacturers received a letter from Mr. Brown reading about as follows:

The machine is not suited to our conditions for these reasons:
(1) It loads coal so fast that it requires a locomotive to keep the cars away from it, and we cannot afford to tie up a locomotive.
(2) The coal costs more when loaded by the machine than when loaded by hand.
(3) I do not want to finally condemn the machine, because we can drive entries with it about four times as fast as by hand, but that is of no advantage to us, as we need no more entry at the present time.

And the loading machine came home in unmerited disgrace.

Examining Coal in Incident Light

By Alfred Gradenwitz
Berlin-Friedenau, Germany

EXAMINATION of coal samples raises a multitude of problems of the highest importance to the scientist anxious to ascertain its nature and origin, as well as to the engineer intent upon investigating the industrial qualities of coal. Though the necessity of resorting to the microscope has in this connection long been realized, the method so far employed, namely, examining thin translucid sections, has involved many serious difficulties. Dr. H. Winter, director of a research laboratory at the Bochum (Germany) Mining College, therefore tried to apply to work such as this a method in current use in metallography, namely, microscopical investigation in incident light. His tests strikingly show the suitability of this method for the examination of opaque minerals such as coal, it not even being necessary in all cases to etch the ground and polished surfaces. Where this is done, however, it is best to use a solution of potassium chlorate and nitric acid.

An electric arc lamp was used in most cases, the light of which was allowed to strike through a lens system, water cooler, light filter and iris stop at right angles to the optical axis of the microscope, the "vertical illuminator," so-called, being arranged between the objective and eyepiece, the beams of light being reflected completely by the prism and illuminating the sample placed on the microscope table. It is also possible by means of a mirror to deflect part of the beams of light from their vertical direction to the microscope axis, directing them at a variable angle against the sample to be examined and making its structure visible.

According to Dr. Winter's results every solid fuel, recent as well as ancient, possesses throughout its mass

FIG. 1—PITCH COAL.
This sample of pitch coal from Bochum has remarkable density and mechanical strength. Magnification 115-fold

FIG. 2—CANNEL COAL.
This coal has magnified four diameters less than in Fig. 1 to all appearances otherwise. Its magnification is only 65-fold.

FIG. 3—[illegible]
This [illegible] which looks much like a piece of [illegible] coke, has been magnified 115 times.

a characteristic structure, the photographic reproduction of which often takes prolonged exposure.

In peat, lignite and true coal, whether recent or ancient, Dr. Winter in incident light noted remarkable cuticle tissues of vessel arrangements, affording a valuable clue to the genesis of coal.

Fig. 1 shows a sample of pitch-coal (jet) possessing remarkable density, mechanical strength and uniform structure. The wood texture prevailing throughout the mass is apparent at first sight. Fig. 2 is a sample of cannel coal of uniform structure, though devoid of any stratification or slaty texture, the whole field of vision being filled up with rounded egg-shaped micro-cells. Fig. 3 represents in 115-fold magnification the appear-

FIG. 4—STRIATED COAL.
In this cross-section can be seen glance and dull coal in sequent bands. The magnification here is only 10-fold.

ance of a pseudo-cannel coal etched in a direction parallel to stratification. This allows polygons to be discerned distinctly, which most likely are cell walls of specific vegetable tissues, the whole interior being filled up with rounded egg-shaped micro-sells. Fig. 4 is a striated coal consisting of a combination of glance-coal and dull coal.

Taking into account the conversion of plants into peat as well as the chemistry of plants, especially that of the process, Dr. Winter comes to the conclusion that all kinds of coal, glance-coal as well as dull coal, should be considered as solid colloidal matter. In the case of some samples of glance-coal, microscopic examination in incident light affords convincing evidence of their being wood products, the longitudinal fibers and tissue bundles coming out most clearly after etching.

A Zeiss metallographic microscope, which, after an unimportant alteration, also allows of investigation in transparent light, was used in this investigation. The new process will doubtless contribute to elucidating a number of contested problems, especially if used conjointly with chemical analyses and occasional microscopic investigation of thin sections.

Bain Issues Timely Warning to Coal Men

HOPING to reduce the present deplorable frequency of mine explosions, H. Foster Bain, Director of the U. S. Bureau of Mines, has issued a statement from which the following paragraphs have been taken:

"Coal has been mined for three months since the resumption of mining following the five months' strike and in that time six explosions, killing about 185 men and injuring more than 100 others, have occurred in the bituminous mines. The number and violence of these explosions is increasing, the record of the past month being the worst of all. The coal industry has not in years suffered as many big disasters and the entire country is properly aroused.

"Coal producers have been properly striving to produce a maximum output to meet the expected heavy demands of the winter trade and to overcome the inroads which had been made in the coal reserves during the recent strike, and intensified activity in any industry increases the risk of accident. The seasonal hazards, which are greater in the coal industry during the winter months, probably have influenced the result. There has been a lessening of morale throughout the coal industry as a result of the strike, which tends toward a less careful attitude of mind. Another probable factor is the change in personnel at the mines following the strike and the shifting of miners to camps where they are not familiar with the dangers, and in places there is a lack of that discipline which is essential to the prevention of disasters whether in fighting a battle or in combating the hazards of nature.

"The letdown of morale on the part of the individual miner is indicated by a startling increase in the number of accidents caused by falls of roofs or of coal falling at the working face. The prevention of such accidents is almost wholly a matter in the hands of the individual worker. In the matter of explosions, however, there is a collective responsibility which begins with the individual whose act or carelessness is the cause of the accident and continues to the operator who permits mining conditions that allow the extension of a local explosion into one spreading through the mine.

"Two effective methods of preventing the extension of explosions by coal dust have been demonstrated in the experimental mine of the Bureau. The first is to wet the dust thoroughly so that no dry dust remains in the mine. The coal dust is made into a mud which cannot be thrown up into suspension in the air by concussion. It is this throwing it up in a cloud along the entry that permits the flame to pass from one volatile particle to another which, when rapid enough, becomes an explosion. It is also possible to dilute the coal dust with shale dust or limestone dust or any non-inflammable dust so that the explosion will not pass from point to point even though a dust cloud be raised by the concussion of blasting or by the wreckage of a trip of cars.

"Either method is effective. The objection to the wetting down is that it must be done every day and must be thoroughly done to be effective. The second greatest coal-mine explosion disaster in this country followed the omission of watering over two days. The shale-dusting method is required by law in Great Britain, where there is dangerous dust, and it is officially approved in France.

"Only eighty-one hundredths of an ounce of coal dust per cubic foot of air space in mine passageways, or 5 oz. per lineal foot of an entry way of ordinary size, which is barely enough to make a thin film when spread on the surface, will propagate an explosion. Treatment methods of some sort are, therefore, necessary.

"Miners and operators, as well as the official inspectors, must take hold of the situation promptly and vigorously or there will be still more serious explosions and more men killed. Knowledge not applied is of no value, however practical it may be in its bearings."

Problems of Operating Men

Edited by James T. Beard

Relative Merits of Retarding Conveyors and Gravity Planes

Unfair Comparison of Retarding Conveyors and Gravity Planes—Delays in Operation of Gravity Planes of Shorter Duration Than with Conveyors

UPON reading the article of Charles M. Schloss in which he describes Utah's only coal-retarding conveyor, *Coal Age*, Nov. 2, p. 717, I feel that the author has been a little unfair in recounting only the good points of the conveyor and the weak points of gravity planes.

As stated in the article, Utah can boast of but one retarding conveyor, in operation at its mines. In justice to the many gravity planes in operation in the state, I feel compelled to give some of the good points possessed by these self-acting inclines and, at the same time, mention a few of the weak points in a conveyor installation.

Record Tonnage and Slight Delays on Operating Inclines

In the first place, it is a matter of record that, by far, the largest tonnages ever produced in Utah have been hauled over gravity planes. These planes are so built that, nine times out of ten, a runaway trip will be caught by a derailing switch and thrown into the clear, thus preventing further damage than the wrecking of the trip, and, possibly, spreading a few rails.

When this occurs, as it will at times, the rails are quickly spiked to gage and operations resumed in a very short time. While runaway cars or trips are always liable to occur, in the operation of a plane, care and good management will render these accidents less frequent.

In his article, Mr. Schloss quotes a prominent engineer as saying, "I have never known a retarding conveyor that has been built right to cause any serious delay; but every so often you hear of a trip getting away on an incline plane."

Numerous Delays Cited in Operation of Conveyor

To my personal knowledge, in the operation of the conveyor he has described, there have occurred two full days' delay, on one occasion, when the tipple shakers were stopped and the conveyor continued to run, piling up the coal at the bottom, until the 6-in. main drive shaft of the shakers was broken.

Several other delays of a day each were caused by the burning out of the armature of the motor driving the conveyor. These accidents were due to the conveyor being left in operation while the tipple was at a standstill. At another time, a delay of three days was caused by the jerking loose of the bull gear, at the end of the conveyor, tearing it from its foundation.

Necessity for Relining Conveyor Causes Delay

This same conveyor is now being relined throughout its entire length of 436 ft., with ⅜-in. steel plate. This expense, together with numerous smaller items, will easily offset the cost of maintenance of a gravity plane and the alleged extra wear and tear on the mine cars passing down and up the plane.

In his advocacy of the conveyor, for handling coal, the writer of the article failed to mention an important fact favoring the installation of a plane for that purpose. For instance, when a conveyor is installed, it is necessary to build an incline or plane for hoisting men and material from the tipple to the mouth of the mine. It is needless to say this extra expense is obviated when a gravity plane is installed to handle the coal.

Greater Number of Cars Required Operating Gravity Plane Offset by Advantages

It is true, as the article states, that more cars are required in the operation of a gravity plane than in that of the conveyor. However, the terminals on a gravity plane can always be so arranged that three loaded trips are on hand ready for the tipple, while a conveyor system permits the handling of a single trip only at one time.

This feature goes far to offset the loss of time when trips do not arrive regularly at the mine entrance, and dumping operations at the tipple must cease till more cars arrive. In my opinion, this feature will account for the larger tonnages handled over gravity planes, as compared with a conveyor system.

One other point remains to be mentioned. It is stated in the article that in the operation of a gravity plane, it is necessary to have a crew at each terminal, and the claim is advanced that the use of a conveyor eliminates one of these crews, whereby a considerable saving in the cost of operation is effected.

This is not a fact in actual practice, however. At nearly all Utah mines operating gravity planes the terminal at the mine entrance at the head of the plane is handled by the motorman or the rope-rider, as the case may be. In each instance, these men take the place of a crew, at the head of the plane, when bringing a trip of loaded cars out of the mine.

Latuda, Utah.

Suggestions for the Government's Fact-Finding Commission

Unwarranted waste in the mining of coal—Low grade coal discarded—Strife between operators and miners calls for government action

ALL right-minded men will mark with pleasure the announcement that the government's Fact Finding Commission, charged with making the necessary investigations to ascertain reliable facts in respect to industrial conditions, is already taking form, as stated in *Coal Age*, Nov. 9, p. 763.

The present condition of the coal industry presents a wide field for the work of this commission. As I reflect on the numerous things that will stand investigating at the hands of this commission, there are two points that appeal to me as calling for their consideration, if the peace and prosperity of our country are to be maintained and the benefits realized.

When I think of the unwarranted waste of coal, both in the mining and the preparation of the product for market, there is nothing with which it will bear comparison [illegible] than the slaughter of the buffalo for its hide, years ago, before the government took steps in its prevention.

Government Stopped Slaughter of Buffalo; Why Not Halt Wasteful Coal?

Many will remember that a few decades ago, the herds of buffalo roaming the prairies were being ruthlessly slaughtered for their hides, while the meat was left to rot on the plains. This continued until the herds of these valuable animals would soon have become extinct, when it was prevented by the government taking measures to stop the slaughter.

The fact is plain that if an organization becomes a controlling factor in the affairs of a nation, the time will be short when that nation will cease to exist. This is not to question the right of men to organize for mutual benefit and protection; but that right must not conflict with the public good and welfare, which the government is pledged to protect.

Let me say, in conclusion, that we can hope for no industrial peace or prosperity without our government maintaining a controlling power. Success to the Fact-Finding Commission in their endeavors to establish a wise and equitable control in the government.

Mine-Safety Conference

Recent conferences on mine-safety problems—Need of certification of mine officials—Reasonable laws respecting gas in mines.

IT was with the deepest interest that I read the letter of Robert A. Marshall, *Coal Age*, Nov. 16, p. 799, drawing attention to the recent conferences on mine-safety problems and the results as outlined in the recommendation offered by the Federal Bureau of Mines, and set forth in a circular letter issued by the Colorado Fuel & Iron Co., to their employees.

Chief among these recommendations appears the emphasizing of the need of certifying all mine officials, including mine superintendents. The recommendations relate to those officials having direct charge of underground operations. The matter is particularly significant, coming as it does from one of the largest coal corporations in the West.

Heretofore, some opposition has been manifest on the part of mine operators toward certificate laws. This developed principally in Pennsylvania and resulted in the certificate law, in that state, being changed in a manner authorizing operators to employ uncertified men who were, in their judgment, equally competent with men holding certificates.

ASSUMED REASON FOR REVISING CERTIFICATE LAW

To my mind, some operators wanted a wider range of choice; they wanted to go outside of the certified list in selecting men to take charge of their mines. Frankly, I would say that the fact of an operator not being able to find the right person on the certified list is evidence that something is wrong. If certified men have not the knowledge and ability to manage mines placed in their charge, much less can we look to uncertified men for such capability.

Evidently, there is need for more study. As has been suggested by different writers in *Coal Age*, many of our certified men cease to study after they have once obtained their papers. If that condition is permitted to continue, our coal-mining problems will become more deplorable and difficult, as time goes on. This is saying much, as it is hard to understand how the situation can be more deplorable than it is at the present time.

Allow me to suggest here that there is one thing lacking among all coal operators and others holding positions that would enable them to combat the present low standard of our coal-mining laws. There seems to be a deficiency of moral courage to agitate what would improve the situation. Selfishness and greed are largely responsible for the failure to act on the principles of the Golden Rule, so often referred to in these columns.

NEED OF EQUABLE LAWS

Attention has been drawn to the need of making our laws more reasonable and such as would not work a burden on some mines while favoring others in the same state or district. In this connection, particular reference was made to the classification of mines as gaseous or non-gaseous; and it was explained how this classification was unjust, in many instances.

In our own State of Indiana, we have a shotfirer's law, which applies with reason to mines generating gas, but is unjust to mines having no gas. In these latter mines, the law is largely ignored as being unnecessary in their case. This fact makes the law inefficient and instances are not wanting where the law is disobeyed in mines to which it should apply.

Speaking of shotfirers, I understand that their wages vary from $7.50 to $25 a day. If this is so, it is a case for the Fact-Finding Commission, recently appointed by our government, to investigate. Certainly, the conditions in a mine where shotfirers are paid this high wage must entail an enormous hazard to life and property and should not be permitted to exist.

No Need for Discouragement

Application for work refused—Applicant discouraged—Honest effort will eventually receive its reward.

WHILE I am not much of a hand in writing, it is always a pleasure to me to read the different letters giving men's experience regarding their work. Some time ago I recall reading an article that interested me deeply. It was a letter written by a man who had applied for a position that he thought himself capable of filling. For some reason, I do not remember just the circumstances in the case, his application was refused.

Instead of accepting the situation and realizing that the company did not need any one at the time, the man became discouraged. It appeared that he laid his misfortune to a general run of bad luck, which made it all the harder for him to keep up his search and find what he wanted.

Because a man's application for a certain position fails to get him a place, is no reason why the fellow should be-

come discouraged. Such a frame of mind unfits a man for service of any kind. Let him take heart and it will not be long before he will find a place waiting for him where the company are looking for honest and reliable men.

After an experience of 32 years in coal mining, much of the time being occupied in bossing or superintending, I feel that men need encouragement and help, and we should seek every opportunity to assure them of our good will. CHARLES TROYE.

West Terre Haute, Ind.

American vs. Foreign Miners

Teaching rudiments of mining in the common schools—Mining experience wanting—Accident list due to employment of foreigners—Co-operation needed to make mining more attractive.

IN HIS article "Teach Rudiments of Mining in the Common Schools," which appeared in the issue of *Coal Age*, Sept. 7, p. 363, Thomas Allen calls attention to the rapid decrease of American miners employed in our mines, today; and thinks this decrease could be arrested if more attention were given to teaching the rudiments of mining, especially in our common schools.

In my opinion, teaching the true rudiments of practical mining in the common schools of the country, would be difficult, expensive and in a large measure unprofitable. As a general thing, the teachers in our public schools know little or nothing about even the simplest rudiments of mining.

Some of the teachers might have a smattering of mining knowledge, just enough to make a huge failure if they undertook to teach the subject. In order to successfully teach mining, the teacher must have both technical training and practical experience in the mining of coal. The best place to study the rudiments of mining is at the face inside the mine, with an experienced and capable miner as instructor.

ACCIDENT LIST INCREASED BY LARGE EMPLOYMENT OF FOREIGNERS

Mr. Allen seems to think that the employment of so many irresponsible and illiterate foreign miners is the cause of the high accident list in our mines. In this respect, I think his view is correct. The employment of so great a proportion of foreign miners, is responsible, in a large measure, for the American boy leaving the mine. As the one comes in, the other will go out.

Digging coal should be considered as honorable a calling as that of a carpenter or machinist. But coal mining has been degraded more than either of these professions by the overwhelming influx of illiterate and undesirable foreign labor. In many mines, today, this irresponsible element of labor has the controlling power. It is nothing strange that such an ingrafting of foreigners into the mines and the results that naturally follow have caused young Americans to drift into other occupations. Our lads with their high American ideals of patriotism and respectability of association, as a standard of life, no longer find mining a congenial means of earning a livelihood and turn from it to seek employment in the shop or factory, though at less wages.

As coal mining has been conducted during the last few years, it has fallen into such disrepute as a profession that few fathers, if any, want their sons to become miners in following after them. Old miners can often be heard to say, I want to get my boy out of the mines and into something else. In the mine, he hears nothing but profanity and murmurings of discontent, from morning to night.

The truth of the matter is that there is no peace to be had, long at a time, under any circumstances in the mines. It is one strike or confusion after another. Miners have grown more unreasonable than formerly, regardless of wages received. High wages no longer make them the contented and loyal citizens that they once were.

In conclusion let me suggest that if labor organizations would change, in many instances, from a policy of "Rule or ruin," to one of business and common sense; and if operators would regard their employees as American citizens, entitled to the rights and privileges of all free men; and place a higher value on moral character and the welfare of the community; violence and strikes will pass into history. If the better element of our miners and operators will co-operate and establish a more friendly system or relationship toward each other, it will make mining more attractive as an occupation, and more of our young men will seek positions in the mines.

Dayton, Tenn. JOHN REED.

Inquiries Of General Interest

Estimating Available Tonnage Per Acre

Observed Difference in Estimated and Tabulated Tonnages—Tables Make No Allowance for Loss in Extraction

REFERRING to the question asked by a Colorado engineer, in *Coal Age*, Nov. 2, p. 721, in regard to the method of estimating the tonnage of coal underlying an acre of land, for a given thickness of seam, I observe that there is quite a difference between the results obtained by applying the rule given in the reply to that inquiry and the tonnage tables published on a "Lefax" sheet, issued some time ago.

The table to which I refer gives the estimated tonnage of coal, per acre, for each foot of thickness of the seam, and for any specific gravity varying from 1.2 to 1.65. For example, for a coal having a specific gravity of 1.2 and weighing 1.2 × 62.5 = 75 lb. per cu.ft., the table gives 1,613.5 short tons (2,000 lb.), for each foot of thickness of the seam. The data given in the table shows the tonnage varies with the specific gravity of the coal and the thickness of the seam.

On the other hand, the reply to the inquiry mentioned gives a rule based on an estimated weight of 1,200 tons of coal, per foot-acre. This rule is assumed to apply to coal of average specific gravity, for either anthracite or bituminous coal, the former being measured in long tons (2,240 lb.) and the latter in short tons (2,000 lb.).

Now, assuming an average specific gravity for bituminous coal of 1.31, the table gives the weight of this coal as 85,125 lb. per cu.ft.; and 1,810.46 short tons, per foot-acre. Or, taking the average specific gravity of anthracite coal as 1.5, the table gives the weight of this coal, per foot-acre as 2,041.87 short tons; or 2,041.87 ÷ 1.12 = 1.825 long tons. These calculations show that the average estimated tonnage, as computed in the table, is based on, practically, 1,800 tons, per foot-acre, measuring the anthracite in long tons and bituminous coal in short tons.

Since this estimate is quite different from the 1,200 tons, per foot-acre, given in the reply to this inquiry, I have been wondering wherein the difference lies. Is this difference due to the table being computed on the weight of coal in the solid and making no allowance for the voids in the broken coal, as prepared for market? INQUIRER.

Philadelphia, Pa.

It should be observed that the reply to the inquiry referred to by this correspondent gives the approximate rule commonly used for computing the available tonnage of coal underlying an acre when the seam is practically level. As he has stated, the rule gives 1,200 tons, per foot-acre, for anthracite and bituminous coal, respectively. The former being measured in long tons and the latter in short tons.

As then stated, this rule assumes an extraction of about 40 per cent of the original seam. It also makes a further allowance of about 10 per cent for

percentage. One applying to lump coal as prepared for the market.

For example, taking the tabulated value as, say, 1,500 tons of average bituminous coal per foot-acre, an 80 per cent extraction would yield 0.80 × 1,500 = say, 1,440 tons of gross run coal. Then, allowing one-sixth, or 16⅔ per cent for screenings, leaves five-sixths of this amount as available lump coal, or, $\frac{5}{6}$[1,440] = 1,200 tons.

The rule is only approximate and must be modified in accordance with the percentage of extraction in the seam and the manner of preparing the coal for market. It is a fairly safe rule for estimate, having in mind this explanation.

Examination Questions Answered

West Virginia Mine Foremen's and Firebosses' Examination. Charleston, 1922

(First-Class, Selected Questions)

QUESTION—*Assuming you have several sets of cross-timbers to take out, and on top of these timbers were several tons of loose rock and slate, explain what would be your method of taking out said timbers and what precautions you would take to insure safety to employees and prevent damage to property.*

ANSWER—The work should be started at the entry end, after a close examination and study of the conditions. The method of proceeding will depend on this examination. As far as practicable, the new timbers set should be put in position before attempting to remove the old ones. If the old timbers stand so close that new sets cannot be placed between them, it will be necessary to carefully take out a single set of the old timbers, replacing it at once with a new set. It will not always be possible to retimber such a place without removing a portion or all of the loose material.

QUESTION—*If powder smoke requires 2 min. 17 sec. to travel 149¾ yd., in an airway 6 × 12 ft. in section, what volume of air is passing?*

ANSWER—Two minutes and seventeen seconds is 137 sec. and a distance of 149¾ yd. is 448 ft. Then, since the sectional area of this airway is 6 × 12 = 72 sq.ft., the volume of air passing = 72 × 897[448 ÷ 137] = 14,152+ cu.ft. per min.

QUESTION—(a) *No gas being generated, would you consider the conditions dangerous if it is dry and dusty at the working face? (b) What precautions would you take in the blasting at and where you find a condition of this kind?*

ANSWER—(a) A dry and dusty condition at the working face in a mine is always dangerous, whether or not gas is generated. This is particularly true where blasting operations are performed.

(b) When the coal is blasted under the conditions named, only permissible powder should be employed and every shot should be examined by a competent person before it is fired. Safer practice is to employ shotfirers to examine, charge, and fire all shots in the mine, after the men have gone home. It is particularly important to remove all coal cuttings and dust regularly from the working faces. Every working place should be thoroughly sprinkled and in a moist condition before a shot is fired therein.

QUESTION—*How would you render first-aid to (a) a victim of asphyxiation from afterdamp; and (b) one suffering from powder burns on neck and back?*

ANSWER—(a) Remove the person as quickly as possible to better air and perform artificial respiration, using the prone method and laying the victim outstretched on his stomach, with his face turned slightly to one side, so as not to obstruct breathing. Also, see that the tongue is drawn forward in the mouth, for the same purpose. Kneeling astraddle of the man, place the two hands or outstretched palms over the small of the victim's back, so as to cover the lower ribs. Then, alternately, compress the body and lungs to expel the gas therefrom, and again relieve the pressure so as to give opportunity for the lungs to expand and draw in fresh air. This action should alternate at about the rate of breathing, say sixteen times a minute, and should be kept up continuously until the victim revives, which may require an hour or more. Never cease until the man revives or is pronounced dead by a doctor. In every case, no time should be lost in sending for a physician.

(b) If the burns are severe, send for a doctor at once. In the meantime, having loosened the clothing or cut it so as to lay it back from the burned portion of the neck and back, exclude the air by applying a thin paste of bicarbonate of soda (baking soda) and water. Starch or flour can be used if the baking soda is not at hand. Vaseline, olive or castor oil, fresh lard or cream, are all good for this purpose. They should be smeared gently over the burned portion and on a thin fine cloth, which should then be laid over the burn so as to exclude the air as much as possible.

QUESTION—(a) *How would you approach the burning section of a mine if you found the condition necessitated the sealing off of the burning section? (b) What steps would you take to insure safety of the workers and the success of their work?*

ANSWER—(a) Much will depend on the conditions existing in the place, the location of the fire with respect to the openings in that section, and the headway the fire has gained. In most cases, greater safety is assured by starting to build the first stoppings at the return end of the section and proceeding in order from that point to the intake end, closing that stopping last. There are two advantages claimed for this method of proceeding. 1. By closing the return opening first, there is at once started an accumulation of burnt air and extinctive gases produced by the fire. This has the effect of retarding the combustion. 2. The intake opening remaining unsealed while closing the return end, more or less air will drift into the space through this opening and help to dilute the explosive mixtures that would otherwise be formed. Where the fire has gained much headway, however, it may often be better to close the intake opening first, so as to cut off the air from the fire. At other times, the stoppings are built up near to the roof and both the intake and return ends closed simultaneously.

(b) To insure safety, none but the most experienced men should be employed and they should be equipped with approved types of safety lamps. Frequent tests of the air at the openings must be made and every precaution taken to avoid the worker being overcome by the gases.

QUESTION—*In case of an accident, in which a workman receives a wound severing an artery, what would you do to prevent hemorrhage and take care of him until the arrival of a physician?*

ANSWER—Send for a physician at once. In the meantime check the bleeding, by strong pressure of the thumb or fingers over the artery, near to the wound and between it and the heart. Still holding the severed artery in this manner, arrange the injured person in a reclining position with his head low to encourage the flow of blood to the brain and prevent collapse. Make no violent movement but keep the man quiet, as any unnecessary movement will tend to increase the flow of blood from the wound. As quickly as possible arrange a bandage with a hard pad beneath it to press on the severed artery. Now apply a tourniquet and twist the bandage sufficiently to bring a strong pressure on the wound. The bandage must not be removed for, say two hours, or before the arrival of a physician. Give no stimulant, except when absolutely necessary to prevent collapse and possible death. Keep the patient warm with blankets and hot-water bottles if these are obtainable.

Wage Plan Fails, So Joint Conference in Chicago Jan. 3 Has No Program for Avoiding Strike

The long effort at Chicago to devise a method for future wage negotiations in the coal industry failed signally. The miners of the "two-by-two committee" rejected the operators' plan calling for negotiations by districts either singly or in such groups as chose to form, for arbitration and for sliding wage scales conforming to coal market prices. So nothing much remained to be done. The committee, composed of two operators and two miners from each of 15 districts, then voted that the main wage conference should be held in Chicago instead of Cleveland, Jan. 3, and that the committee should meet an hour before the main session in a last-minute effort to make some sort of helpful report to the big assemblage. Nobody expects anything to develop at this last-gasp meeting. Thus the main conference is expected to remain at deadlock unless some new element shall be injected into the situation before Jan. 3.

The "two-by-two committee" was appointed at the October joint conference in Cleveland, when that main session failed to agree upon a wage-making method. It was directed to convene in Chicago Nov. 14 and try to do around a table what the big joint meeting had failed to do in a smoke-filled ballroom. It tried for four days, beginning Nov. 14, and failed. It tried again last week, the operators' half of the committee striving for two days and finally framing a proposal they could agree upon. When the miners in the joint session of the committee Dec. 6 would have none of it, the committee quit in despair. The Jan. 3 main conference is supposed to begin actual wage negotiations, but it is freely prophesied that the struggle is going to be a troublous one and that any kind of agreement by April 1 to prevent a strike will be difficult.

Committee's Final Session of Short Duration

The final session of the "two-by-two committee" Dec. 6 was a short one. When the operators read their proposal to the miners at 11 in the morning there was an immediate howl of disapproval from union men. Both President Lewis and Secretary Green, of the union organization, declared peace ought to be established in the industry, but they followed this by making it plain that the miners would stand for nothing less than the setting up again of the old four-state plan of negotiations with a flat scale for the whole country and with nothing even faintly resembling arbitration. The operators quickly agreed to eliminate the sliding wage-scale provision but stuck solidly to the clauses for negotiations by districts either singly or in groups (without specifying what the groups should be) and for arbitration of wage questions by either a non-partisan or combination jury.

In the afternoon session there was a great deal of more or less nimless oratory but no definite accomplishment until about 5 o'clock, when the operators' proposal was put to a vote and lost, each side voting as a unit. Then the miners' proposal that the old four-state plan be continued lost with equal ease. The committee had failed. John Brophy, of the miners, was the man who suggested that the committee reconvene just before the joint conference Jan. 3. The motion was adopted, but without any display of enthusiasm.

The committee took into its own hands the question of changing the Jan. 3 conference from Cleveland to Chicago. On this question every man present voted as an individual and Chicago was selected by a narrow margin of three votes.

The proposal for wage negotiations which the operators agreed upon and which the miners rejected, but which no doubt will be brought up in the Jan. 3 conference as written by an operators' resolutions committee, follows:

"(1) The uniform and inflexible policy pursued by the United Mine Workers of America in the past of fixing a basic wage scale in one district grouping of a limited number of states producing a minority portion of the bituminous tonnage of the country, and by the centralization of power enforcing said wage scale upon all other districts of the country without regard to the competitive conditions affecting the other said districts, is rapidly destroying the business of the operators in many unorganized fields and is the chief contributing cause of overdevelopment of the industry.

"There are indictments for conspiracy now pending in the federal court of the district of Indiana against representatives of the mine workers and representatives of the operators who have formerly participated in the negotiation of wage agreements for the Central Competitive Field (Ohio, Illinois, Indiana and western Pennsylvania) which make it imperative that a new method of negotiating wage agreements be formulated. Therefore, we recommend:

"(a) That each of the United Mine Workers districts jointly represented in this conference be constituted a wage-scale-making body with full right of autonomy to negotiate wage-scale agreements based upon competitive conditions found existing and affecting each such district and, further, each such district shall be vested with the right to join with any other district or districts as may be mutually satisfactory to the mine workers and the operators of the district or districts affected, for the purpose of negotiating wage agreements for such sections.

Provides for Joint Conference of Districts

"For the purpose of negotiating wage-scale agreements to be effective upon the expiration of the present wage agreement namely, April 1, 1923, the following named districts: District No. 2, central Pennsylvania; District No. 5, western Pennsylvania; District No. 6, Ohio; District No. 10, Washington; District No. 11, Indiana; District No. 12, Illinois; District No. 13, Iowa; District No. 14, Kansas; District No. 17, West Virginia; District No. 21, Oklahoma, Arkansas and Texas; District No. 22, Wyoming; District No. 23, western Kentucky; District No. 24, Michigan; District No. 25, Missouri, and District No. 27, Montana, shall exercise their inherent right under this resolution and by mutual agreement between the mine workers and operators of each of the districts or sections hereinbefore mentioned shall meet in joint conference at such place as the operators and miners of each district or section may agree, such meetings shall convene in all districts on Jan. 8, 1923, for the purpose of negotiating wage-scale agreements. The action of any wage-scale-making district or section shall be binding only on that district or section and shall not be binding or have any effect whatsoever upon the making of a wage-scale agreement in any other district or section.

"(b) Further, in the interests of public policy and in order that there shall be guaranteed continuous fuel supply and entire prevention of strikes, there shall be no suspension of work during the period either of negotiation or such arbitration either in the district or section, we recommend that in the event of failure of joint wage-scale committee of any district or section to reach a satisfactory wage-scale agreement, the points in dispute shall be submitted to a neutral board of arbitration composed of three members of recognized ability and high public standing, to be appointed by the President of the United States, and neither of whom shall have any connection either direct or indirect with the coal industry, or a board of arbitration consisting of one representative of the mine workers and one representative of the operators and a third member, neither a miner, an operator nor interested in the coal industry directly or indirectly, to be appointed by the federal judge of the district where such arbitration is to be held. The decision of such board of arbitration on any point of dispute to them referred shall be final and binding upon both sides.

"(c) Further, we recommend that each district or section agreement negotiated shall carry a clause providing for a flexible wage scale which shall permit, when competitive circumstances shall demand, an adjustment of wage scale that will allow of free competition between all districts."

All Set for Herrin Trial to Start Dec. 13

The tedious job of choosing twelve good men and true to try the small host of men charged with murdering and conspiring to murder twenty-one non-union coal miners and guards at the Lester strip mine near Herrin, Ill., last June is completed. The twelve are more than half miners. Members of the United Mine Workers of America, which is defending the prisoners, have been paying part of their earnings into a special union assessment checked off supposedly for the defense fund. These jurors, however, have all sworn they are uninterested and without prejudice and can vote a death penalty if that seems just. The state used liberally of its peremptory challenges to keep union veniremen off the jury, but it could not be continued forever. Most men drawn for each venire were union miners because the county is so solidly unionized.

Judge D. T. Harwell has issued a warning against any sort of demonstrations in the court room during the impending trial, which was scheduled to start Wednesday, Dec. 13, with the opening statements of the attorneys. "No testimony will be laughed at," says his statement. "No expressions of approval or disapproval will be allowed. If anyone in the audience makes such expressions before the jury I will send that person to jail." Thus the stage is set for the trial.

Keeney Murder Trial to Begin in January Before Judge Woods in Morgan County

Trial of C. Frank Keeney, president of district 17, United Mine Workers of America, on the charge of being a murder accessory, such a charge growing out of the armed march of last year, will begin soon after Jan. 1. Keeney's trial is to be in Morgan County under a second change of venue granted by Judge J. M. Woods. Morgan County is in Judge Woods' circuit, so that Keeney's trial will be under Judge Woods' direction just as all the other trials growing out of the armed march have been. Morgan County was selected by Judge Woods as the county for the trial after attorneys for the state and for the defense had failed to reach an agreement, as there is no coal mined in Morgan and because Judge Woods felt that it was not involved in the industrial controversy. Court will be convened at Berkeley Springs, Jan. 2.

Accidents in October Killed 186 Miners, 3.46 Per Million Tons Produced

Accidents at coal mines in October caused the death of 186 men, according to reports from state mine inspectors to the U. S. Bureau of Mines. Twenty-five of the fatalities were at anthracite mines in Pennsylvania and 161 at bituminous mines in all states. In October a year ago 180 miners were killed, including 42 at anthracite mines and 138 at bituminous mines. The death rate for October, 1922, was 3.46 per million tons of coal produced; a year ago the October rate was 3.43. During September, last, there were 153 fatalities, or 3.31 per million tons produced.

The average fatality rate for October during the past nine years (1913-1921) is 4.27 per million tons of coal mined, and the average number of lives lost during the same period is 238. It will thus be noted that the October, 1922, rate is much below the average rate for October for the nine-year period.

The loss of 186 lives in October, 1922, has brought the total number of deaths at coal mines during the first ten months of the present year to 1,378, as compared with 1,665 during the corresponding period of 1921. By a strange coincidence the fatality rates for the two periods are identical, 3.92 per million tons. The output of coal this year has reached 352,000,000 tons, while during the ten-month period last year the production was 425,000,000 tons.

Accidents due to causes other than explosions show no material change in frequency from those that occurred last year, except in the case of deaths due to the use of powder and other explosives, for which the rate has declined from 0.315 to 0.187 per million tons.

COAL-MINE FATALITIES DURING OCTOBER, 1922, BY CAUSES AND STATES

Is Strike Unavoidable? Western Operators Look Into Future as Through a Blue Glass Darkly

Is there bound to be a strike of union coal miners April 1?

Midwestern opinion among coal operators tends to follow one channel on this question. Only two things can prevent a strike—assuming that union bullheadedness continues—and each of them is rather indefinite. Either some unexpected factor enters the situation from the outside or some few operators with clouded vision and limber spines sign on the union's dotted line. Neither is confidently expected.

About the only source of a possible new factor is the Federal Coal Commission, and operators recognize that the commission is neither empowered nor expected to take a hand in the wage battle. It might possibly make some helpful suggestions in an early report to Congress; that's all. If these do not influence miners to recede from their stand for a continuation of the present wage scale and negotiation by regions at least as large as the four-state field, or if they do not make it somehow seem advisable for the operators to swallow the union's dose, then there is little hope of avoiding another coal crisis.

"I seriously can't decide which would be worse for the operators and the industry, a strike or a new agreement on the present wage scale," said an official of a company operating more than a score of mines. "A strike would mean a definite shutdown for all union mines while a settlement on union terms—which seem about the only terms that can be made without war—would keep coal so high in a season of probable poor demand that most mines, unable to dig coal cheaply enough to sell it, would either be closed all the time or would operate on such a hit-and-miss basis that the whole business would be continually at sixes and sevens. As between the two I don't know but that a strike would be preferable."

Thinks Fight to Finish Might Not Be Unmixed Evil

Another important Western operator frankly declared: "Six months of undiluted hell in a strike might be the very best thing for the whole industry. In the first place I don't think the union could weather it by any means as well as it did the last strike, and in the second place such an occurrence would give the Federal Fact-Finding Commission the best possible opportunity to see the evils of the industry come to a head. Such an unhappy event as a strike would focus the attention of the country, official and unofficial, on coal, so that really the situation would be of benefit to the commission in its effort to suggest remedies for the industry's ills. Nothing could then keep the commission's recommendations from getting full and undivided attention in Congress and elsewhere."

There is a general wish by operators everywhere that the commission do something soon that may clear the air at least a little. If it were to induce the Attorney General to define the government's position regarding four-state or other group agreements between operators and miners, it would have accomplished something for the direct benefit of everybody interested in coal, including the public, many men believe. This, of course, would have to be done within the next two or three months to be effective. But even this would not be conclusive. The Attorney General might express an opinion about the legality of group agreements which would bind nobody in case a new Attorney General were to succeed Mr. Daugherty. It would be far more beneficial if pressure could be brought to bear upon the federal court at Indianapolis to try at once the case against the 225 miners and operators long ago indicted for conspiring in four-state negotiations to restrict production and keep the price of coal up.

The failure of the miners and operators in special joint committee at Chicago to agree upon a method of future negotiations causes no unhappiness among Midwest operators. Since the miners would agree to nothing short of a resurrection of the four-state plan whose legal status is still so much in doubt, and since there is always a chance that the situation will take a new turn before April 1, when the present agreement runs out, it is considered advisable that no plan whatever be adopted for the time being.

"My idea of what to do," says an operator who has been playing a leading part in every recent labor struggle, is this: "On Jan. 3 if it still seems impossible for the operators to agree upon any plan acceptable to the miners, let's then go into session with the miners in the old four-state group. That will be better than to quit cold and it will not necessarily mean any settlement. We can chew the rag with Lewis until the very last cow comes home, offering him every reasonable plan which would allow the coal industry to work—a thing it simply can't do next summer at present wages—and then, if nothing crops up from the outside, why the strike will have to come, that's all. We'll fight it out about as usual, probably losing out in the end, but at a cost to the miners that they can hardly stand."

It is the general opinion in the coal trade that the union would have a harder row to hoe in a strike next summer because of the unlikelihood of a companion rail strike to aid it. Also it is generally believed that next time the government will not adopt the same attitude it took last summer.

Mining company officials with long experience are beginning to advise their superintendents to prepare to store coal wherever possible about the mining properties, and already storage arrangements are being made against a shutdown. Naturally industries are going to do a good deal of storing as the winter wears along unless a settlement appears more likely than it does now, and possibly the storage piles of the country next April 1 will be stupendous.

Illinois Operators Agree Not to Ask More Than $4.50 at Mine for Domestic Coal

Prices on domestic coals produced in southern Illinois have been adjusted by a number of operators, as shown in the following statement, issued Dec. 8 by Federal Fuel Distributor C. E. Spens:

"The following named coal operators in the Fifth and Ninth districts of Illinois have individually signified to the Federal Fuel Distributor a willingness not to exceed $4.50 per ton as a maximum f.o.b. price at the mines on prepared sizes of coal for household use, and in most instances these operators have stated that this maximum will be observed at least until April 1, 1923:

Southern Coal, Coke & Mining Co., St. Louis, Mo.
Breese Trenton Mining Co., St. Louis, Mo.
Mount Olive & Staunton Coal Co., St. Louis, Mo.
Prairie Coal Co., St. Louis, Mo.
St. Louis & O'Fallon Coal Co., St. Louis, Mo.
Groom Coal Co., Belleville, Ill.
Egyptian Coal & Mining Co., St. Louis, Mo.
Abbey Coal Corporation, Carbondale, Ill.
Jones Bros. Coal & Mining Co., Marion, Ill.
Mulberry Hill Coal Co., Freeburg, Ill.
Kolb Coal Co., St. Louis, Mo.
General Coal & Mining Co., Freeburg, Ill.
Dolese Coal Co., Belleville, Ill.
Fullerton Coal Co., Belleville, Ill.
Bank Twin Coal & Coke Co., St. Louis, Mo.

"These operators represent approximately 40 per cent of the production in these districts. Some of the best grades of domestic coal in these districts have been selling for as high as $5.50 per ton, and some have been selling, and are today selling, for less than $4.50 per ton. The maximum price of $4.50 should tend to establish prices on the different grades of domestic coal on a proper commercial level."

The various drafts of codes for mine rating and car distribution rules which have been laid before the Interstate Commerce Commission were discussed at a meeting of the railroad relations committee of the National Coal Association held in Washington, Dec. 11. The whole subject of rating and rules was discussed and the committee has under consideration supplemental suggestions which will be submitted to the Commission.

Wholesalers in Informal Conference with U. S. Coal Commission

[illegible] W. Marton, of Albany, N. Y., president of the American Wholesale Coal Association, and Nash H. Smith, Jr., of Philadelphia, held an informal conference with the United States Coal Commission Tuesday afternoon, Dec. 2. The scope of the wholesale coal business handled by the commission and the service performed by the wholesaler was discussed. The supplying of business credit to the small coal miner on the one side and to the smaller industrial consumer on the other was stated as a necessary function and an estimate of $100,000,000 was given as the total commercial ratings of members of the association. Coal engineering also was mentioned as a part of the service rendered to the coal consumer by the wholesaler, who in these days seeks to sell service along with the coal.

At this preliminary conference President Marton promised to submit through a formal statement to the Coal Commission suggestions on the points which have been discussed by representatives of the other branches of the coal trade. The executive committee of the association will convene at Washington, on Thursday, Dec. 14, and on Dec. 15 will meet the commission and submit in detail their observations, suggestions and recommendations.

H. J. German to Serve Fact Finders In Advisory Capacity

Arrangements have been perfected whereby H. J. German, vice-president of the Montour R.R., will serve the President's coal commission in an advisory capacity. In rounding out his technical staff, C. E. Lesher, who is in immediate charge of the engineering phases of the commission's investigations, found that he must have the help of a practical man experienced in moving coal.

Mr. German was reared, practically speaking, on the Chicago, Burlington & Quincy R.R. He also has had Western transportation experience in Colorado. He was in charge of the open-top car pool for the Railroad Administration from late in 1917 until September of 1919. In the latter month he was called upon by the Railroad Administration to direct the handling of coal during the big strike and during the emergency period which followed it. The success which followed his efforts at that time has caused him to be regarded as one of the best coal transportation specialists in the country.

Navy Asks Bids for 139,600 Tons of Coal For Navy Yards and Naval Stations

The navy has called for bids for 139,600 tons of bituminous or semi-bituminous run-of-mine coal for navy yards and naval stations. Tenders on sixteen classes are called for, among the principal items being the following: 50,000 tons for the Brooklyn Navy Yard; 5,400 tons, navy supply depot, South Brooklyn; 8,500 tons, naval air station, Lakehurst, N. J.; 25,500 tons, navy yard, Washington, D. C.; 10,000 tons, White Plains, Md.; 12,500 tons, Naval Academy, Annapolis, Md.; 14,000 tons, navy yard, Norfolk, Va.; 17,000 tons, naval operating base, Sewalls Point, Va.; 6,400 tons, Naval Hospital, Norfolk, Va.; 4,000 tons, navy yard, Charleston, S. C. The bids are to be opened Dec. 15.

Coal Commission Finds Bituminous Coal Industry Overdeveloped 30-60 Per Cent

Studies already made by the U. S. Coal Commission all point to the fact that the bituminous coal mining industry is overdeveloped. "Too many coal mines and too many miners" describes the situation in plain English. In these coal mines more capital is invested and more miners are employed than are needed to produce the coal the country requires. This condition, of course, involves waste on a countrywide scale.

How great is the present inflation of the industry cannot be stated exactly at this time, but unquestionably the inflation is excessive. Estimates of the excess mine capacity range from 30 to fully 60 per cent above the country's normal demand, which for the last five years has averaged about 510 million tons a year.

How to deflate the coal industry is one of many problems before President Harding's coal commission, and its reports may be expected to present facts bearing on this question. It seems plain enough, however, that the industry should not be further inflated by opening new mines.

J. W. Adams Probes Wholesale and Retail Distribution for Coal Commission

J. W. Adams, who is making studies of wholesale and retail distribution for the President's coal commission, is widely known in the coal industry as a result of having traveled extensively as a field agent for the Federal Fuel Administration during the war. During that period he

J. W. ADAMS

also served as director of prices for the Illinois Fuel Administration.

Mr. Adams is a native of Whiteside County, Illinois. His higher education was obtained at the Geneseo Collegiate Institute at Geneseo and at Northwestern University. Immediately after being graduated from the latter institution he joined the technical staff of the Federal Trade Commission, where he served until the outbreak of the war. When the war-time Fuel Administration was dissolved Mr. Adams returned to the Federal Trade Commission, where he has served as an economic examiner since.

Only Two Bids Submitted for Navy Coal

Only two bids were received in connection with the tenders requested on Dec. 6 by the Navy Department for fuel supplies for New York harbor, the Brooklyn Navy Yard and for the Navy Yard at Philadelphia. The Iron Trade Products Co., of Pittsburgh, offered to furnish 12,000 tons for railroad delivery Dec. 15 to Jan. 31 at $6.51 per ton and 6,000 tons for barge delivery during the same period at $5.95 per ton.

The Morrisdale Coal Co., of Philadelphia, made a tender of $7.35 per ton for 12,500 tons for barge delivery, Dec. 15 to Jan. 31. On another lot of 6,500 tons a price of $7.30 was quoted.

The Navy had called for bids on 15,000 tons of steaming coal for delivery f.o.b. at New York harbor and the Brooklyn Navy Yard, and 4,000 tons for delivery under the chutes at piers Philadelphia and 200,000 tons for delivery at Hampton Roads. An additional 18,000 tons of run-of-mine was requested for delivery at Philadelphia.

No Mediation of Wage-Scale Disputes Will Be Undertaken by U. S. Coal Commission

By Paul Wooton
Washington Correspondent of *Coal Age*

No fact finding which can be interpreted as mediating or arbitrating wage-scale disputes will be undertaken by the President's Coal Commission. This point was made emphatically clear by John Hays Hammond, chairman of the commission, in announcing that John L. Lewis and representatives of the mine workers and certain mine operators had been requested to confer with the commission.

Mr. Hammond declared that the commission is much concerned because of the failure of the Chicago conference to adopt machinery to negotiate wage scales for the coming coal year. He stated that the commission is fully alive to the gravity of the situation and that it had asked representative men on each side to confer with the commission. He pointed out that the conference is to be an informal heart-to-heart talk, in which the members of the commission will urge each party to the controversy to get together. Mr. Hammond declared, however, that the commission will acquaint itself thoroughly with the facts surrounding wage-scale matters.

One company, it is reported, made a detailed return on the cost questionnaire on the fifth day following the despatch of the questionnaire from Washington.

Chairman Hammond revealed that it is the intention of the commission to conduct formal public hearings on the important controverted issues during February. At these hearings arguments for and against nationalization of the coal mines, among other things, will be taken up. On the completion of those hearings, the commission expects to visit the mines.

As representatives of the operators, the mine workers, wholesalers, retailers and the carriers confer with the commission, each is being asked what he would do were he in the commission's place.

Will Gather Only Statistics Submitted Under Oath

Rather than take the chance of having its work discredited by having its figures questioned, the President's coal commission will insist on gathering statistics from individual operators, who make the return under oath. The members of the commission realize that their fact-finding activities would be simplified greatly were they to accept the figures of the various local associations. Were they to rely on these figures alone, it is feared that some members of Congress would make an issue of that point and thereby bring discredit upon many of the commission's findings. The commission apparently feels that it must be 100 per cent sure of its basic facts and must not leave itself open to destructive criticism regardless of how reliable the members of the commission may regard the figures of the local associations.

There were extended discussions between members of the commission and the bituminous operators' special committee, of which J. C. Brydon is chairman. These meetings consumed the greater part of two days, Dec. 6 and 7. The committee was assisted in its presentation by John W. Davis and Goldthwaite H. Dorr, of counsel.

The main object of the committee's visit to the commission was to obtain further information in regard to the cost and labor questionnaires. The conferences, however, were not confined to a discussion of cost and labor returns. Consideration was given to a wide range of coal mining questions.

The operators' committee contended that there should be simplification and clarification of these forms, but the commission rather was of the opinion that the data called for are necessary to an intelligent consideration of the subject and that the instructions on the forms are ample. It is possible that some changes will be ordered in the labor form going to non-union operators.

After the conferences the operators' committee sent out a statement to the members of the National Coal Association asking all operators to fill out these forms to the best of their ability and forward them promptly to the commission.

As a result of these conferences it is believed that the operators are more convinced than ever that the commission is making an earnest and intelligent effort to be of help to the coal industry. The desire to co-operate constructively in that effort is even stronger since this meeting. The committee very evidently is doing all that it can to convince coal operators generally that it has faith in the commission.

There is no disguising the fact that the commission is not well impressed with the operators' policy of employing expensive attorneys to assist them in the presentation of their cases. Mr. Davis has been Ambassador to England and Solicitor General of the Department of Justice. Were the commission considering certain international matters it would be willing to admit no doubt that Mr. Davis could enlighten it, but the issue presented at the time he made his brief statement for the coal operators was how best to determine the number of days an operative works in a mine. It is believed the commission would have been more interested in hearing from some of the accountants working in the offices of the operators than from such a distinguished legal light.

More Legal Notables to Be Heard

Apparently the commission is to hear further from distinguished counsel, as there is a rumor that the operators are about to engage former Secretary of War Stimson to assist them in their work with the coal commission. It is known that the commission is wondering why it is necessary to pay an attorney a single fee which is more than double the aggregate of the annual salaries of the members of the commission, when any one of a dozen operators who appeared before them last week is in a position to be of greater help in furnishing information which would enlighten the commission. The question naturally has arisen as to whether or not these large legal expenses form a proper item to add to the cost of coal.

The operators who participated in the conference with the commission were J. C. Brydon, T. W. Guthrie, S. H. Robbins, T. B. Davis, F. W. Wilshire, S. L. Yerkes, J. D. Francis, T. M. Farrell and J. D. Ord.

It was stated at the commission that much valuable information had been received from the representatives of the wholesalers who appeared before them last week. One of the points which appears to have impressed the commission very strongly is the fact that the wholesaler performs an important function in financing small operators and in extending credit to retailers.

The document submitted by the retailers is being studied. The fact that they emphasized their government fuel yard hobby has raised the question among the commissioners as to whether or not the proposal of the retailers to give the government a preferred price would not entail the same evil as grows out of lower prices on railroad fuel, which shifts more of the cost onto other consumers.

Washington, D. C., Dec. 11—Subpoenas were issued today by the President's Coal Commission to obtain testimony from several retail coal dealers as to the current price of anthracite. The hearing will be open to the press.

Check Off $4 by Dec. 15 or Indiana Strikes

Chicago, Dec. 5th—Unless the operators of Indiana agree by the night of Dec. 15 to check off a total of $4 from each mine worker's earnings for national union dues additional for November and December the whole state will be struck. John Hessler, president of District 11, delivered this ultimatum to the operators on Saturday, Dec. 2, after a week of wrangling with them over the legality of the addition under the terms of the contract. At first the operators refused to agree to it in a meeting Dec. 4. Since then their sentiment is said to have softened. The decision was scheduled to be made at the quarterly meeting of the Indiana Bituminous Coal Operators' Association on Wednesday, Dec. 13. Some operators made the November additional check-off, asserting that they didn't understand it because of evasive union explanations.

The proposal made to the operators' quarterly meeting was that Judge Anderson's District Court at Indianapolis, where 225 operators and miners were indicted for contempt lately because of the check-off, be now petitioned to enjoin the union from striking to enforce the check-off. This might draw from Judge Anderson some sort of decision as to the legality of the check-off. Those operators who went into the meeting weakening in the face of the union's demands contended that the legality of refusing the $4 for national dues was doubtful and that the question at issue is only a technicality not worth a strike.

The difficulty arose when it was learned late in November that the increase in the check-offs made at the mid-month pay included $2 for the national. It had not been explained to the operators that this special and temporary addition to the check-off was for that purpose, hence many of them paid without question. In cases where questions arose over the size of it, various answers were returned by the secretary-treasurers of the locals and the increases in most cases were spread over several items such as funeral expenses, initiation fees and the like.

On Nov. 28 Secretary Penna, of the operators' association, sent out a letter advising such operators as had been paying the swollen check-off to quit doing it, as it was in violation of the terms of the contract. He suggested that operators should not violate the contract if they expected the union to stand by it. On Monday, Dec. 4, an operators' meeting was held in Terre Haute at which the more or less complicated question of the justice of the thing was threshed out. The first vote on refusing to make the check-off was passed 35 to 15, 5 not voting; then it was made unanimous.

The contention was that President Hessler of District 11 had called the two-month increase a "special assessment" and therefore it could not be called "dues" collectable under the check-off clause of the agreement, which reads: "The operators shall offer no objection to the check-off for the checkweighman and for dues to the U.M.W. of A. provided that no check-off shall be made against any person until he shall have first given his consent in writing to his employer."

Mr. Hessler said in Chicago afterward that the "special assessment" was strictly union dues and therefore legitimate under the contract and that such mines as did not check it off at the mid-month pay would be struck and the rest would suffer at the last-month pay, Dec. 23.

Supreme Court Annuls Kohler Cave-in Law

Washington, D. C., Dec. 11—The United States Supreme Court handed down a decision today declaring the Pennsylvania subsidence law unconstitutional. This law, the Kohler Act, was commonly known as the "cave-in" law, inasmuch as its avowed object was to prevent the mining of anthracite under cities or other property which might be endangered by sinkage. The opinion was read by Justice Holmes. A dissenting opinion was filed by Justice Brandeis.

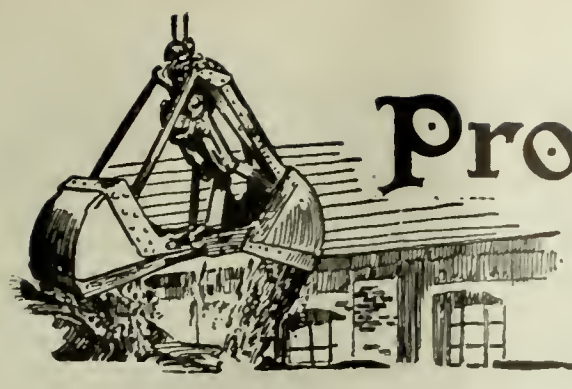
The case at issue was styled Pennsylvania Coal Co., plaintiff in error, versus H. J. Mahon and Margaret Craig Mahon. The Attorney General of Pennsylvania and the City of Scranton intervened as interested parties. In this particular case one house was involved. The coal company showed that a deed to the property had been executed in 1878 conveying the surface but in expressed terms reserving the right to remove all the coal under it. The Court of Common Pleas held that the Kohler Act if applied to the case at issue would be invalid. The Pennsylvania Supreme Court agreed that the coal company had contract and property rights protected by the federal Constitution, but held that the state law was a legitimate exercise of police powers of the state and directed a decree for the owners of the surface. The coal company appealed by writ of error.

Commerce Commission Rescinds Open-Top Restrictions and Priorities

All restrictions on the use of open-top cars have been removed by the Interstate Commerce Commission and all priority of movement of certain commodities has been cancelled as of Dec. 11. This action was taken Dec. 8, when the commission issued Amendment No. 4 to Service Order No. 5 and Amendment No. 2 to Service Order No. 24.

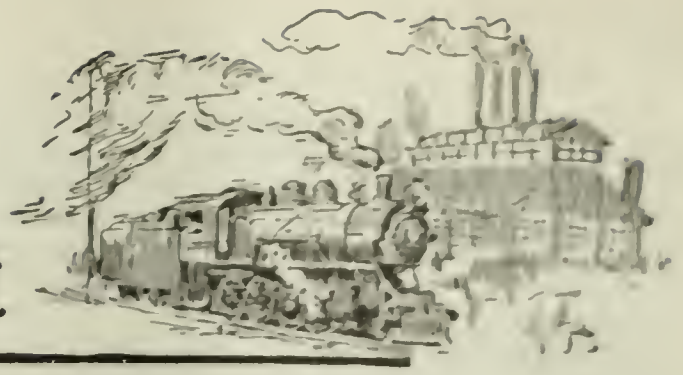
Service Order No. 22 is the only general service order still outstanding. This order directs all common carriers to forward traffic to destination by the routes best calculated to expedite its movement and to relieve congestion. There are a few orders outstanding dealing with the placement of cars to meet individual and specific emergencies.

The amendments follow:



Amendment No. 4 to Service Order No. 11.—It appearing that the emergency which caused the commission on the 19th day of August, 1922, to make and enter its Service Order No. 21, and the amendment thereto made and entered on the 19th day of September, 1922, has been measurably relieved, it is ordered that said Service Order No. 24, as amended, be, and the same is hereby, vacated and set aside effective at midnight, Dec. 11, 1922.

Amendment No. 5 to Service Order No. 25.—It appearing that the emergency which caused the commission on the 19th day of September, 1922, to make and enter its Service Order No. 25, and the amendments thereto made and entered on the 17th of October, 18th of November and 23d of November, 1922, has been measurably relieved, it is ordered that said Service Order No. 25, as amended, be, and the same is hereby, vacated and set aside effective at midnight, Dec. 11, 1922.



Amendment Penalizes Refusal to Answer Questions and Making False Returns

Washington, D. C., Dec. 11.—Representative Winslow of Massachusetts, chairman of the Committee on Interstate and Foreign Commerce of the House of Representatives, has introduced the amendment desired by the President's Coal Commission intended to remove all doubt as to the liabilities entailed by refusing to reply to questionnaires or for making false returns. The $5,000 fine and imprisonment for not more than one year is to apply not only to those who refuse to testify or who testify falsely but to those who refuse or neglect to answer any written questions propounded by the commission or any officer or agent thereof, "as herein provided for, and any person who shall wilfully give false testimony in respect of any matter or thing under investigation by the commission or shall make or cause to be made any false entry or statement of fact in any written answer or report called for by the commission or any officer or agent thereof, and any person who shall make or cause to be made any false entry or statement of fact in any book, account, record, document, correspondence, paper or other evidence, with intent to deceive the commission or any officer or agent thereof."

The amendment also provides that "judges of courts of the United States shall be eligible for appointment as members of the commission, and the appointment, qualification and service of a judge as member shall in no wise affect or impair his tenure as judge." This amendment is necessary to permit Judge Alschuler to qualify as a member of the commission. It provides that he is to receive his judicial salary while serving with the Coal Commission and that his traveling and per diem expenses may be paid by the Coal Commission.

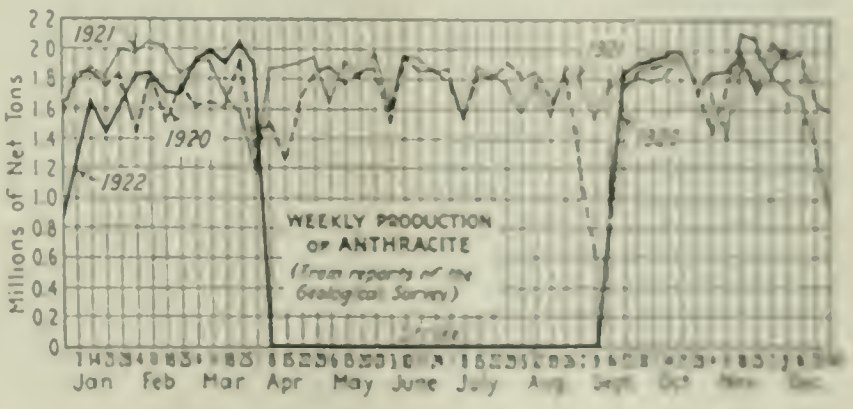
Production and the Market

Weekly Review

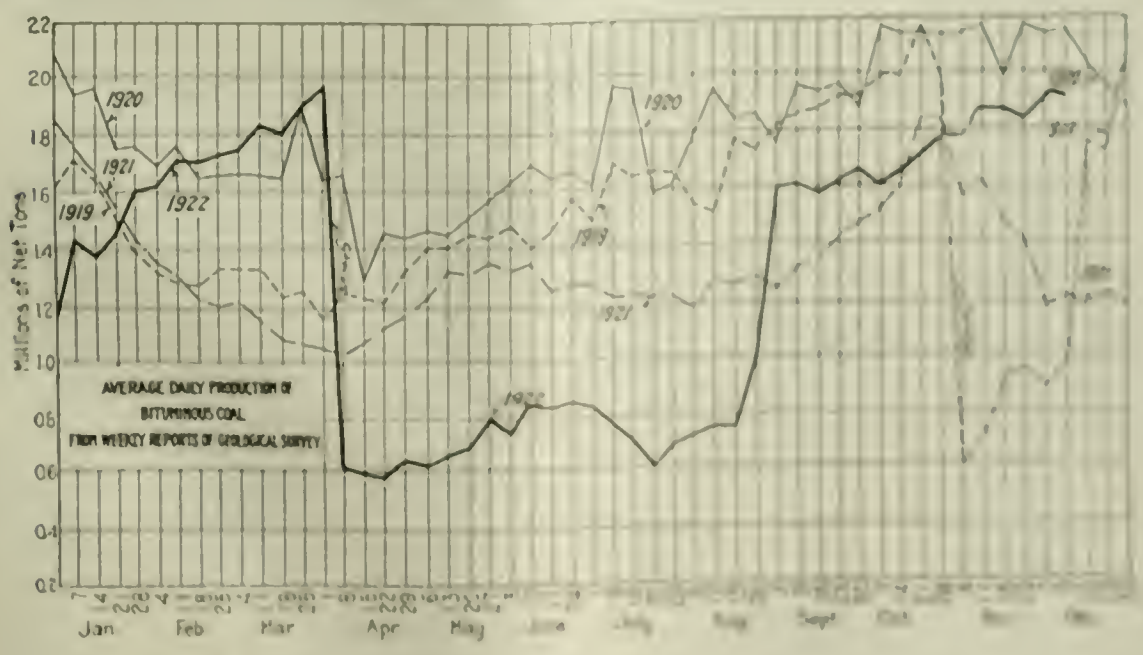
Steam and domestic markets continue to see prices holding up well in the face of poor demand. The week opened with sagging prices on steam coals in every market save the North Atlantic region, where both high- and low-volatiles from Pennsylvania fields are holding their own and even exhibiting strength for the choice brands. Excepting only southern Illinois, the domestic lump prices are not sufficiently strong to sustain the generally weak steam demand and such fields as the Belleville, Hocking, Kanawha and Ohio No. 8 record price declines.

Difference in Markets a Complicating Factor

The smokeless situation is complicated by the difference in the markets East and West. The East will not pay more than $4.50 at the mines and the West is reaching for the same coal at prices up to $8. Difficulties in making deliveries westbound over both the Norfolk & Western and the Chesapeake & Ohio and the comparative amplitude of the supply at Tidewater account for this difference.



Production of bituminous coal is holding up around the 11,000,000-ton per week mark and although car supply continues to be the principal factor limiting production, lack of market is shutting down mines west of the Mississippi and limiting the running time of a number of small mines producing low-grade coal in the East.



There is some stocking of soft coal by large consumers around Baltimore and by railroads in the Northern territory. Considering the country in general, however, there is little spot buying and what stocking is taking place is on contract. The East is feeling some stimulus from the purchases of retailers who are buying substitutes for anthracite. The New York State Fuel Administration now requires purchasers of domestic sizes of anthracite to accept 25 per cent of substitute fuel and forbids the sale of more than a month's supply of range and pea.

Several weeks ago it appeared that a large tonnage of soft coal might be left over at lower Lake ports. The last few days have seen a clean-up of these accumulations. It is expected now that there will be no holdover, the loading of 288,869 tons of Lake coal in the week ended Dec. 11 practically clearing out the accumulations and setting a new record for the first week in December.

The production of anthracite is holding up at high levels, prices being limited only by the conscience of the seller and the fear of the authorities. Company prices are, of course, unchanged. Dealers in out-of-the-way places report they can obtain plenty of independent coal of desirable sizes at mine prices of $12@$14. Distribution is under the control of the anthracite operators with a central organization in Philadelphia, the policy of which is governed, of course, by the Federal Fuel Administrator in Washington.

Restoration of man power in the Connellsville region, which was hit by the strike last summer, has now progressed to the point where mine labor and car supply for coal and coke combined are in excess of the market demand.

BITUMINOUS

The total estimated output of soft coal in the week ended Dec. 2, including coal coked, mine fuel and local sales, was [illegible] net tons, according to the Geological Survey. As Thanksgiving Day reduced the working time during that week to about 5½ days the average daily production was 1,909,000 net tons, the highest rate attained in any week this year.

"Preliminary reports of cars loaded during the week ended Dec. 9 indicate nearly the same rate of production and a total output of about 11,100,000 tons," the report continues.

"The estimated cumulative production of bituminous coal this year to Dec. 2 inclusive, stands at 365,387,000 tons, which is 11,500,000 tons, or 3 per cent, less than in the corresponding period of 1921; 139,970,000 tons, or 28 per cent, less than in 1920; 59,717,000 tons, or 14 per cent, less than in 1919; 174,800,000 tons, or 32 per cent, less than in 1918, and 145,000,000 tons, or 28 per cent, less than in 1917. The cumulative production of soft coal during the first 284 working days of the past six years has been as follows, in net tons:

[illegible]	[illegible]	1920	505,166,000
1919	[illegible]	1921	377,286,000
1918	[illegible]	1922	365,387,000

"The mine reports for the week ended Nov. 25 reveal the fact that increased traffic difficulties were largely responsible for the slump in production during that week. Increased losses through transportation, though generally small, were widespread and perceptible improvement occurred only in the Harlan district and in Arkansas.

"Losses attributed to no market were general throughout the Western states, except in Utah and New Mexico. Of the Eastern fields only Illinois, New River and western Kentucky showed losses of more than 1 per cent through lack of demand.

"Frequent rumors have been heard of a softening of the Eastern markets, but the limitation placed upon production by transportation disability has been such that apparently there has been little difficulty in absorbing all the coal that could be transported.

"All-rail movement of coal to eastern New York and New England increased in the week ended Dec. 2 principally and notably in the quantity of anthracite shipped. Three thousand and 55 cars of bituminous coal and 4,247 cars of anthracite were forwarded, as compared with 2,770 cars and 3,020 cars, respectively, in the corresponding week in 1921."

Railroad coal is understood to constitute the bulk of the movement recently. Prices on Southern coals are such as to

Coal Age Index 325, Week of Dec. 11, 1922. Average spot price for same period, $3.93. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared and run-of-mine normally shipped and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board.

encourage central Pennsylvania all-rail purchases, where the requirements and demand are more than normal for this time of the year.

Hampton Roads situation continues dull. Tonnage on hand at the C. & O. and N. & W. piers gained last week and dumpings likewise increased. At Sewalls Point, on the

contrary, coal on hand and coal dumped last week showed a decline from the previous week. The interest of the producer is in a high-priced Western market, where, however, he can ship but a small portion of his output. Eastern buyers, of course, take advantage of this, thus holding Hampton Roads prices down.

Nov. 15, 1922	4,643		[illegible]	[illegible]
Same date in 1921	215,000	[illegible]		

End of the Lake season is fast approaching. During the week ended Dec. 11 cargo coal dumped reached [illegible] and fuel coal 8,267 net tons, a total of 288,869, which is a high figure for this time of the year. The season's total is now past the 19,000,000-ton mark, approximately [illegible] tons behind last year. The Northwest is abundantly supplied with soft coal, for on top of the Eastern coal via Lake, all-rail coal from Illinois keeps pouring in.

ANTHRACITE

Work at the anthracite collieries virtually ceased on Thanksgiving Day, and in consequence production for the week ended Dec. 2 declined to 1,813,000 net tons, according to the Geological Survey. This estimate is based on shipments of 34,788 cars, including besides freshly mined coal, that recovered by washeries and river dredges, and allowances for mine fuel and sales to the local trade. Although this was less than in recent preceding weeks it was 10 per cent more than the output in Thanksgiving Day week of 1921 (1,650,000 net tons). Preliminary reports of cars loaded during the first four days of the week of Dec. 4 indicate that output will be about 2,100,000 tons.

COKE

Production of beehive coke improved slightly during the week ended Dec. 2, in spite of the occurrence of Thanksgiving Day, according to the Geological Survey. The coal output is estimated from railroad shipments at [illegible] net tons, an increase of 4,000 tons over the week before. With the exceptions of Utah and Washington, all districts showed improvement, or at least maintained the record of the week preceding.

The steady improvement in the Connellsville region that began early in June finally halted and, according to the *Connellsville Courier*, the output in that region increased from 301,100 to 303,700 tons. The Courier attributes the decline to the temporary shutdown of two furnaces for repairs, with a consequent curtailment in demand for coke.

Foreign Market And Export News

British Coal Output Again Shatters Record; Buying Pressure Relaxes

After a slump during the week ended Nov. 18, British coal output recovered and during the week ended Nov. 25 established a new high mark for the year, with 5,472,000 tons mined. This is 36,000 tons greater than the previous week's output and 51,000 tons more than the previous record made during the week ended Nov. 11.

Buying pressure has now relaxed, but new business is coming along at a steady total for best grades and collieries are not concerned with the outlook, showing no desire to relax prices materially. Current exports are still up to the pre-war level. Colliery owners are well booked for the next week or so, so far as the superior grades are concerned, but secondary and lower grade coals, especially smalls, are still in greatly excessive supplies.

There has been a disposition on the part of foreign buyers, in view of the adverse exchange rates and other factors, to hold back fresh orders with the object of forcing down prices, but with the approach of the Christmas holidays miners believe that this bolshevism process will not last long.

Increased exports are reported to France, South America, Spain, Greece and coaling stations, but Italian shipments declined approximately 22,000 tons and minor declines are recorded to Portugal, Canada and other countries. The direction of export for the week ended Nov. 17 was as follows:

To	Tons
[illegible]	125,145
[illegible]	45,781
[illegible]	74,910
[illegible]	18,233
[illegible]	8,878
[illegible]	8,215
[illegible]	14,162
[illegible]	3,127
[illegible]	84,198
[illegible]	74,229
Total	451,468

The coal market in north England is quiet. Buyers are showing a tendency to hold off. Germany, though in need of coal, finds the exchange so adverse that deliveries are being postponed for the present. The collieries are well booked up for the most part to the end of the year and concessions in prices are confined to buyers with tonnage which will fit into loading positions. There are complaints of congestion and delay in loading at the Tyne ports and the teamers and trimmers have been urged to return to the three-shift system of working as the only remedy, so far without success.

Welsh owners are complaining bitterly of inadequate loading facilities at Cardiff and are pressing for longer working hours for loaders. The Great Western Ry. has made a request to the coal tippers and trimmers to accept the three-shift system of working at the docks. The workers have opposed the three-shift system all along, and still express emphatic opposition to the change. The colliery owners and coal exporters generally advocate the three-shift system, as savings could be made in freight and dock charges, which would help to cheapen the cost of coal to foreign ports.

Output Greater in Northern France

Most of the collieries of the Nord and Pas-de-Calais are unable to accept new orders for domestic coals except for delivery after the end of the present year. Industrial coals also are becoming scarcer.

Pithead stocks in that coal field, which in April last amounted to nearly 2,000,000 tons, have gradually decreased until now they may be estimated at about 300,000 tons.

On the other hand, the coal output of the North of France had increased as follows in October:

	Sept., 1922 Tons	Oct., 1922 Tons
Non-departmental mines of the Pas-de-Calais	616,006	638,190
Departmental mines of the Nord and Pas-de-Calais	694,234	728,164
Totals	1,310,240	1,366,354

British coal imports, which had increased in October have been interfered with to some extent by the recent rise of sterling. For the same reason French coals made a quite unusual appearance on the Antwerp market.

The situation in the French Central and Southern coalfields, excellent for domestic coals, is fairly satisfactory for industrial coals, although the iron works in that part of France might be more active.

Coke from the Loire coal field is in good demand from Switzerland and Italy.

Sarre coals, owing to the collapse of the mark, are being more largely diverted from German into French home markets.

Parisian coal factors who agreed to an increase in contract prices in order to obtain domestic coal contracted for in Belgium—a step which was against all admitted rules—find deliveries no better since the revision than before, and their association has just written a strong letter about it to the Association Charbonnière du Bassin de Charleroi.

From Nov. 1 to Nov. 19, inclusive, Germany has delivered to French blast-furnaces 219,000 tons of reparation coke, which is at the rate of 346,000 tons per month, whereas 410,000 tons per month is due.

In October 1,261,499 metric tons of coal were received in French maritime ports, as follows:

	Metric Tons

World Coal Production, July-August

In comparing present coal production with the average pre-war production it will be seen that France, on account of her gain in territory, produces more coal at present than before the war and this in spite of the fact that the coal mines in the northern departments of that country suffered seriously during the war. In addition to her own production France receives monthly about one million tons of so-called reparation coal, so that the country is better off than before the war as far as coal is concerned. The greatest decrease has taken place in the United States, probably on account of the miners' strike. German production remains far behind that of the ante-war time—by about one-third—chiefly due to the loss of mining districts and partly due to the decreasing output. Great Britain's coal production also remains considerably behind pre-war time, but has largely increased as compared with the preceding year (miners' strike) partly due to the strike in America. An increase in production as compared with ante war production took place in the Netherlands, South Africa and Japan.

MONTHLY AVERAGE OF COAL PRODUCTION

Increased Bunkering in Liverpool

The expansion in Mersey bunkering in 1922 as compared with 1921, says a Northern weekly, is illustrated in the figures for October, which are now available. These show that in the ten months ended October there was an increase in bunker shipments from Liverpool of 742,790 tons as compared with the ten months of 1921, and 267,575 tons increase in Manchester bunker shipments over the figures of 1921. The official bunker shipments for the two ports for the ten months of this year as compared to 1921 are as follows:

Liverpool Ten Months Ended October 1921 Tons	October 1922 Tons	Manchester Ten Months Ended October 1921 Tons	October 1922 Tons
1,155,157	1,897,947	67,554	335,132

The relative positions which the main bunkering ports occupy so far as volume of bunker export is concerned for the month of October, 1922, was as follows:

Port	Quantity Shipped Tons
Cardiff	246,716
Liverpool	212,919
Newcastle and South and North Shields	141,125
Hull	132,335
Glasgow	111,652
London	110,419
Manchester	29,492

The total shipments as cargo from Liverpool in October of this year were 79,232 tons, and from Manchester 34,829 tons, and the total from the northwestern ports of the United Kingdom 114,561 tons, which compares with a total of 10,856 tons in October, 1921.

POLAND—According to statistics from Kattowitz the coal production in Polish Upper Silesia from Oct. 23 to 29 amounted to 461,728 tons. Of this, 231,686 tons were sent abroad to various states of central and northern Europe, Germany getting the largest quota, 167,362 tons, Austria next with 44,062 and Czecho Slovakia, 1,854 tons.

Week-End Strength at Hampton Roads

The market at Hampton Roads showed signs of strength at the end of the week, although dullness was the main feature throughout the period. Car shortage continued the outstanding factor in the trade, with little prospect of immediate improvement in the situation.

Bunker business was showing more activity, but the coastwise and foreign trade was extremely dull. January 1 was the earliest date set by shippers as promising any improvement in a general way.

The market was spotty during the week, prices depending somewhat on the class of cargoes demanded. Few dealers had sufficient supplies to give any sort of flexibility to their trade. Small lots in most instances were the general thing.

Prices Firm on High Grades, Slipping on Low Qualities

Car Supply Improves Slightly—Buyer's Indifference on Quality Prevents Price Recession—Railroads Heaviest Buyers—Woodin's Order Expected to Be Helpful Factor

An indication of the market situation in this territory is found in the firmness of prices on high-grade coal, while quotations on low-grade coal here and elsewhere over the country are slipping. Car supply is slightly improved in a number of spots but the indifference of the buyer on quality has prevented marked price recessions.

Railroads are now the heaviest buyers. Some of them are accumulating good stocks. Here and there there is some inquiry for delivery after the first of the year for storage against another big strike, but the market is not the least nervous over this possibility at this writing. Producers are more concerned now with getting for their coal a price that will yield a profit on the short car supply than in quoting prices for the first quarter of next year.

Fuel Administrator Woodin's order to buy one-fourth substitute as fuel with household anthracite is calculated to relieve the pressure on bituminous coal as well as anthracite steam sizes at Tidewater.

NEW YORK

The better grades are growing stronger and scarcer. At times operators are in a position to take care of orders and offer reasonably quick delivery, while at other times this is impossible because of the uncertain car supply.

There is a heavy demand for prepared bituminous domestic coals and most buyers are heavily booked ahead. Quotations on some grades are from $6.25 for furnace to $6.50 for range.

The Southern market is tightening considerably, reports indicating that some operators are hesitating to accept further business.

Shipments of British coal to this port have practically ceased. A local house points out that British coal can be landed in Boston at $1 less cost than American coals.

There were 1,886 cars at local terminals Dec. 4 as compared with 1,478 cars Dec. 2. Comparatively little of this tonnage was better than Pool 11 grade while there was considerable of cheaper coals.

Some fancy grades were quoted around $4.75; low-sulphur gas coal, run-of-mine, $3.50@$4; 2 lump, $4.25@$4.50; high-volatile steam grades, $3.75@$4.25; and slack, $2.50@$3.

PHILADELPHIA

The spot market on the distinctly high-grade coals remains quite stiff at last week's prices, with some reporting advances. The supply of cars nowhere seems to be anywhere near the demand and unless decided relief is soon given, prices must soar still higher.

The consumer remains fairly cheerful and pretends to be puzzled for a reason for the recent stiffening of prices. However, those with orders placed several weeks ago at more favorable than the current prices are now insisting on prompt shipments. The railroads are still the biggest takers of fuel, and have accumulated good stocks.

Some shippers are not particularly anxious for business even at present prices, as they are doing their best to clean up orders placed three or four weeks ago. This refers to the best of the low-volatile steam coals and some high-grade gas fuel.

At tide there is only ordinary bunkering, while pier business is not even that.

BALTIMORE

The early part of last week witnessed a slide in prices for all except the better grades of soft coal, but the recession proved brief. At this writing there has developed a decided call for fuel from large consumers, public service corporations being particularly active in purchasing.

Several coal men here who had reported that they were having difficulty in getting rid of Pool 11, and even Pool 10, now say these are absorbed as rapidly as offered. During the past week while Pool 9 coal held pretty well above $4, the net ton f.o.b. mines, Pool 10 was offered around $3.50, Pool 11 around $2.75 and Pool 18 at from $2.25 to $2.50. The gas coal market was off also, Pool 64 being obtainable in many cases at $2.75 and Pool 63 at $3.25@$3.50. At this writing, however, there has been an advance of 25@50c. right along the line and not much of Pool 10 is now on the market below $4. Very little of Pool 9 is now offered here and is readily commanding $4.50.

FAIRMONT

Keeping pace with the general market, prices have been showing a downward trend but marked recessions have been prevented owing to the fact that a shortage of cars is still retarding production. Yet car service is somewhat better, in spots at least, and some mines during the period ending Dec. 2 had as large a supply as 50 per cent. In general the range on mine-run is $2.75@$3.25, with egg and lump ranging $4.50@$4.75.

CENTRAL PENNSYLVANIA

Improvement is noted in the situation both as to cars and prices. A new market is opening for bituminous coal that can be adapted to use where formerly anthracite was used. Coals for this use are found in Pools 1, 9 and 71 and the price is strong at $4.75@$5. Pool 10 advanced from $3.90 to $4.10, and Pool 11 from $3.50 to $3.75. Railroad supply cars are being cut down, thus leaving more cars for commercial distribution.

Production for the month of November will reach 80,000 cars, as compared with 82,714 in October. Complete figures are not yet available. During the week ending Nov. 26 the production was 18,552 cars as against 19,849 cars the previous week.

UPPER POTOMAC

Upper Potomac and Georges Creek fields in the aggregate have not been able to produce as much coal as during the latter part of November chiefly because Upper Potomac mines fell behind previously established records to the extent of 13,000 tons. The loss was solely attributable to a car shortage, market conditions having played little or no part in curtailing production, though prices have been declining as the demand waned somewhat. Pool 18 is bringing as low as $2.50 per ton.

West

DENVER

Car supply that is growing slowly better continues to increase the output of Colorado and the market in this city and elsewhere in this region has whetted up sufficiently to absorb the production without much forcing. Domestic demand is fairly strong and industrial call for steam coal is picking up a little. Canon City and Walsenburg lump is selling at the mine for $6@$6.50 and Trinidad lump at $5.50. Nut from these fields runs about 50c. lower than this. There is a noticeable firmness in all domestic coals.

KANSAS CITY

"No-bill" cars in the southern Kansas field have begun to move. The surplus at the mines is estimated at from 50 to 75 per cent less than it was two weeks ago. This is attributed partly to the advent of colder weather but more to idle time at the mines. One company, with headquarters in Kansas City, reports its mines have been operating only 25 per cent of normal, while other firms report between 25 and 50 per cent.

The transportation situation remains about as it has been since September, with perhaps a little more blame for slow movements placed upon lack of motive power than upon lack of cars. It is estimated that at the present rate of demand, dealers have sufficient coal in their yards to last 30 days. Quotations on Kansas coal are: Lump, $5; nut, $4.50; screenings, $2.50. Arkansas semi-anthracite lump is $6 and screenings $1.50@$2.

SALT LAKE CITY

Mines are working around 56 per cent of capacity now. Market conditions are fair. The demand for lump coal is such that the smaller sizes may soon constitute a problem. Stocks in Salt Lake City are still low but now that the car situation has improved the severest weather is not likely to precipitate a crisis. Labor conditions are excellent.

Anthracite

Wintry Winds and Bare Bins Stir Tardy Householders

Cold Blast More Potent Than Warm-Weather Warnings—If Present Output Can Be Maintained Anthracite Problem Will Be One of Distribution.

Cold weather is focusing attention of the householder on the ever present lack of sufficient anthracite to meet his needs. Warm weather warnings of shortage to come broadcast by every local administrator and retail dealer in New Jersey and New York failed to stir the householder like one week of sharp cold and a short supply in the cellar.

Providing production can be maintained at its present rate of around 2,000,000 net tons per week, which figures, of course, include about 200,000 tons, or 10 per cent used by the mines themselves, the anthracite situation may be summed up as a problem in careful distribution aiming at eventual equality but seeking to fill the more distant points first.

The market for steam sizes in anthracite continues exceedingly dull. Some are hopeful that buckwheat at least may move in more volume as a substitute for larger sizes when the consumer gets really pinched.

NEW YORK

In an effort to relieve the domestic situation and at the same time reduce the tonnage of small coals on the railroad terminals in New Jersey, in boats and in the retail yards the State Fuel Administration on Dec. 8 issued instructions to retailers that deliveries of two tons or more of grade, broken, egg, stove, chestnut or range coal must be preceded or accompanied by not less than 25 per cent of buckwheat, coke, bituminous or other substitutes.

Dealers are buying more independent coal because of the demands made upon them and inability to obtain larger shipments from the companies.

Outside of price increases already announced by some of the companies, some of the larger independents have advanced their quotations, mostly to cover the Pennsylvania State Tax.

Consumers here need not go without fuel. When they are unable to get the particular size wanted there is always some substitute available. No suffering has been reported as yet.

Quotations reported during the week included some washery chestnut at $12.75 and washery pea at $9.75 f.o.b. mine.

The steam-coal situation is clearing up. At the end of the week there were upward of 100 loaded boats in the harbor, some of which it was said had been loaded a couple of months. All three sizes are stronger, with rice the most inactive. The better grades of independent buckwheat and rice were quoted above company circular while some cheaper grades were quoted below.

BUFFALO

Delivery is still slow, though emergency cases are not as numerous as they were. Complaints are made that with a good increase of mining over former autumns much less coal has been sent this way than in the past.

Shippers who handle independent anthracite say that the demand for that coal is so active that prices are stiffening. They find it next to impossible to get any coal unless one stays on the spot and sees that the cars are not billed to anyone else. Canada has been buying Welsh anthracite at about $18 delivered, but that is now cut off by the closing of the St. Lawrence River season.

The lake trade, which is coming to a close, has been smaller than expected. At the close of November shipments were 947,080 net tons. Shipments for the first six days of December were 56,300 tons. Freight rates since Dec. 1 have been uniformly $1 per ton.

BALTIMORE

The hard coal situation is not at all satisfactory but dealers realize that this is a general situation and not a local one. As a matter of fact nature was a bit good to Baltimore during the recent very cold snap which swept the West and Northwest by sending the cold area around this section and not through it. The result has been that while the period since Dec. 1 has had some raw days it has not been marked by extremely cold ones and coal consumption was held down very materially. Dealers, however, are rather anxious about the last days of December and are hoping that there will be a material increase in shipments here.

During October Baltimore coal dealers received a total of 1,478 cars of anthracite, but November saw a drop of 213 cars from this record. December so far has failed to show any increase. Dealers in Baltimore are trying as far as possible to co-operate with the Maryland Fuel Distribution Committee, and agreed willingly to take care of emergency cases whenever possible.

PHILADELPHIA

Colder weather has increased demand, with dealers poorly prepared to meet it. Though mine prices have been radically increased by some independents, and lesser advances made by company shippers, the increase in retail prices has been moderate. There is still quite a good deal of coal being sold at $14.50 for family sizes and $11.50 for pea. Of course this is by dealers who are getting mostly company coal. Other dealers have increased from that point up to $16.

Substitutes, such as bituminous coal and coke, are making headway. Progress also is being made on buckwheat as a domestic fuel although most dealers insist that a portion of buckwheat must go with each order for larger sizes. Yet even on this fuel dealers are reporting satisfied customers who have used the coal in steam heaters without mixture, and expect a regular trade on this size in the future. Prices for buckwheat at retail are as @$9.25.

The steam coal market is better. Little free buckwheat is available at less than $3.50 and many smaller producers with the good grades are getting $4. Of course the companies have not cut this price. Rice is still plentiful, with probably the least improvement shown in this size. Barley is in good demand but with a fair supply still offered on the market.

BOSTON

Domestic sizes are seriously in short supply in most of the cities. It is difficult to generalize for the whole of the territory, for distribution is by no means horizontal, depending upon originating companies that have varying policies in sending coal forward. A really notable effort has resulted in adequate supplies for the present in points like Bangor and Augusta up the Maine rivers, but ports open to navigation through the winter have been kept on hand-to-mouth deliveries. There is some ground for expectation, however, that after Jan. 1 the general situation will be easier.

There is no special change in the retail situation. The City of Boston has landed at the Navy Yard a cargo of Welsh steam coal, called "semi-anthracite," and is making deliveries at $14.65 per net ton. Retail dealers are managing measurably well to keep regular customers supplied with small amounts, the great difficulty is over householders who duplicate orders.

South

BIRMINGHAM

So far the approach of the holidays has stimulated the market very little. The railroads are reported as buying a little extra coal for stocking, but aside from this, general demand is no greater than for several weeks past. There is no surplus supply, however, as production is restricted by car shortage.

Domestic grades are still in strong demand and scarce, conditions in the steam trade limiting supply from commercial mines and lack of equipment adversely affecting both classes of operations. Dealers are receiving about enough coal to meet wants of consumers.

Prices on both steam and domestic grades are practically unchanged from last week. Production is about 340,000 net tons per week. Car supply ranges from 40 to 60 per cent of normal requirements, the former representing the supply at furnace mines and the latter that of commercial and domestic operations.

VIRGINIA

Losses in production have resulted from inability of the railroads to keep up car supply, the result of which has been to increase the production of coke, which now amounts to about 12,000 tons a week. "No market" losses have not made their appearance, the demand still being amply sufficient to absorb all that the field can produce.

Chicago and Midwest

Market Slightly Better For Both Steam and Lump

Both Far Below Normal for This Time of Year—Even Raw Weather and Indiana Strike Threat Have Little Influence—Cars More Numerous

The recent slump of domestic trade was practically stopped during the past week by raw weather but the general market remained so quiet that the volume of fuel offered dwindled. This had the inevitable effect upon steam coal, which strengthened slightly but did not develop into anything even faintly resembling a rush. A consistent effort on the part of a few railroads and a group of big consumers to restrain Illinois prices by accepting considerable quantities of cheap western Kentucky coal has had the desired effect in Chicago. The demand for select domestic has increased the price of Eastern smokeless a little, but that is primarily because there is almost none to be had.

What little strength there is has been more apparent in Chicago than elsewhere, though in Kentucky there is a better feeling in both domestic and steam, and in St. Louis, while domestic demand is nearly flat, steam has picked up ever so little. Car supply generally is better just at a time when "no bills" are numerous.

SOUTHERN ILLINOIS

Last week's story of this region is a repetition of the report for the past few weeks: Warm weather and no demand. The only coal moving with any ease is screenings. Larger sizes go only under pressure. While the association operators are still maintaining their prices, the ranks of the independents seem to be growing. Association prices are $3.50 for lump, egg and nut. The independents have gotten down to $3 for nut and from $3.50 up for lump and egg.

Some mines have a hard time working two days a week on account of no orders. There seems to be plenty of cars for the business offered. A shortage of water is a serious factor. The same conditions prevail in the Duquoin field as to prices, working conditions and water supply.

Mt. Olive district is almost at a standstill. A little coal is moving north and west and steam sizes in Chicago and on contract, but the domestic demand is almost nil. Domestic prices in this field still stick at $4 for 50-Lump shipments and range from $4.50 to $5 in the country. The railroad business is fairly good out of both Mt. Olive and Carterville fields.

The Standard mines are about demoralized on prices. Two-inch lump is around $2.50, steam, nut and egg $2 @ $2.25 and screenings $1.25@$1.50. The 6-in. lump is from $3 up. Everything is hard to move and most mines have unbilled coal. Car supply is in excess of the demand.

ST. LOUIS

Summer weather prevails, with summer business. Domestic buying is at a standstill. Steam wagon business is unusually light on account of the weather and carload business is slow. The only demand is for a little screenings.

All over the Middle West cars are strung out on consignment and a lot of coal is rejected because it was not ordered or because the dealers have refused it for any one of several reasons. Dealers are all loaded and cannot take any further shipments regardless of price. A little anthracite is moving through. No smokeless and nothing from Arkansas is arriving. Some Alabama coke is coming to this territory to replace anthracite chestnut, but the tonnage is light.

WESTERN KENTUCKY

It is reported that demand has been just a little better the past week as a result of colder weather. Prepared leads while mine-run sells in fair volume. Increased consumption by heating plants and better industrial buying are making the market slightly firmer.

As a rule car supply is taking care of present demand fairly well, although the usual complaints are heard. A fair tonnage is moving out through the state and South, with some into southern Indiana and to St. Louis. River movement from western Kentucky has been checked for weeks by low water, but recent heavy rains are expected to improve boating stages.

Prices in the western Kentucky field are firm. Mine-run is $2@$2.50; lump, $3.50@$4; screenings, $1.25@$1.50 for pea and slack, and $1.50@$1.75 for nut and slack. Demand for egg and nut is improving.

INDIANAPOLIS

Little change was seen in the coal situation in Indiana until the threat of an immediate strike was made. Then most big buyers who depend upon Indiana mines started a rush for coal. Warmth has held down domestic trade. Better transportation facilities are providing plenty of coal for industries. Prices are about the same though there is a little strength in steam coal. There appears to be slightly more demand than a month ago, but the slight increase in demand has had little to do with the price. Industrial users say they can get screenings at around $2.25 at the mine. There is no apparent effort to begin building up reserves, though the threatened tie-up of Indiana mines is causing some concern.

CHICAGO

A gentle pick-up in domestic demand from various quarters and a continuance of the steady but slow call for screenings characterize the market. Raw weather has had small effect upon domestic trade. Yards still have so much soft coal on hand that it will require the worst kind of winter to empty them and create much liveliness. Steam consumers show little sign of heavy stocking. They still are satisfied to go along slowly, picking up a little fuel for storage only when considerable quantities got into distress here.

The only recent increase in price on this market is in Eastern smokeless, which reaches here in the thinnest kind of stream. Smokeless mine-run brings $6@$6.25 and those occasional cars of lump and egg which appear bring $7.50 @$8.25. The presence of a fair quantity of anthracite has its effect on West Virginia domestic. Thus, while southern Illinois circulars have steadily quoted lump and egg at $5.50, there have been various recessions. Today, however, that price is fairly firm and central Illinois is maintaining its $4.50 level with much better success. Eastern Kentucky prepared stays well above $6.

LOUISVILLE

Colder weather has resulted in slightly better demand for prepared sizes, as well as industrial coal. Prices in eastern Kentucky are making for slower demand, but operators, while needing business in mine-run, assert they are able to sell full production of lump, and screenings output is light and taken up without much trouble.

In eastern Kentucky operators are asking $6@$6.50 for 2-in. lump and small prepared, while block is quoted at $6.50@$6.75, with Straight Creek operators and some Harlan operators asking $7. Not much coal moving at prices over $6.75. Mine-run is quoted at $3.50@$3.75 for gas while non-gas and screenings are $3@$3.50.

Western Kentucky movement is better in view of lower prices, which are quoted in the Louisville market at $3.50 @$4 for lump, $2@$2.50 for mine run, and $1.25@$1.75 for screenings, buyers to pay brokers' commissions.

Railroad buying is reported as quiet, while general industrial demand is a shade better, although on a hand-to-mouth basis. Retailer buying is much improved

South

TORONTO

There is practically no change in the situation as regards anthracite. Moderate supplies are being received by the dealers, who refuse to receive orders when these are disposed to until further consignments come in. Consumers unable to wait can generally obtain immediate delivery of "brokerage" coal by paying higher prices, which average about $18 per ton. Some Welsh coal remains which is being rapidly disposed of at $15.50 per ton, deliveries being delayed by a rush of orders.

Prices for carload lots of bituminous f.o.b destination are a little easier, ranging $8.50@$9.25 and Pennsylvania smokeless $8.25. There is no noticeable increase in the demand.

Eastern Inland

Fears of Huge Lake Surplus Have Largely Disappeared

Clean-up at Lower Erie Ports Promises to Be Unusually Good—Domestic Prices Easier Than Elsewhere—Consumers Await Price Fall.

Fears of a week ago that the Lake season would suddenly close and leave a huge tonnage to be thrown back on the local market have largely disappeared. In the week ended Dec. 11 there was dumped 288,869 tons of cargo and bunker coal in lower Lake Erie ports and it is now expected that the clean-up will be unusually good.

Domestic prices are easier in this section than in any other part of the country, warm weather and a plentiful supply softening prices on such coals as Hocking, No. 8, Kanawha and eastern Kentucky.

Consumers are patiently awaiting the market drop and steam prices are losing strength every week.

BUFFALO

Trade is very quiet. Supply is running ahead of demand and prices, of course, are weakening. Shippers try hard to hold up prices and are succeeding fairly well so far, but they are apprehensive of the full force of the lake closing.

Better car supply is responsible for more plentiful coal, but it is by no means good; if it were prices would touch bottom. Predictions of considerably lower prices are made by shippers, but that may not happen right away. Then if the railroads should go to stocking up that alone would add stiffness to the market.

Consumers say their stocks are increasing. They are now able to mix in coal at present prices with some that they bought awhile ago at higher prices. Consumption keeps up and may be increasing.

Quotations are $4.75 for Youghiogheny gas lump, $3.75@$4.25 for Pittsburgh and No. 8 steam lump, $3.25@$3.50 for all mine-run and $3 for slack, adding $2.09 to Allegheny Valley and $2.24 to other coals to cover freight to Buffalo.

PITTSBURGH

The market continues to soften, except on domestic lump, which is strong in price and shows unsatisfied demand. Car supply shows no great change.

The chief movement is on contract. Little coal is moving through the open market in odd lots. It is thought that many consumers are stocking a small part of their contract receipts.

Regular Pittsburgh district steam coal remains quotable at $2.50@$2.75. Connellsville steam coal, some Sewickley seam and some regular Pittsburgh seam is offered freely down to $2.25 and there has been some curtailment of production on account of not finding takers. Odd lots of good grade Youghiogheny gas coal can be had for $3 and good sized lots for regular shipment over a short period fall short of $3.50. Byproduct coal shows little activity, but could probably be picked up at $3@$3.25. Some contracts for particularly good grades have been adjusted to $3.75 for December shipments. Domestic 1¼-in. lump is bringing $5@$5.50 in most quarters. The Pittsburgh Coal Co. continues to bill at $4.50.

COLUMBUS

There is a slight weakness in domestic sizes, caused principally by the continued warm weather. Retail stocks are generally good, but dealers are loath to increase them under present conditions. Retail prices are steady at former levels with Hocking and Pomeroy lump moving fairly well.

Steam trade is quiet. Steam users have accumulated stocks for 15 to 45 days. Consumers apparently are waiting for lower prices, regardless of the possibility of a strike April 1. Utilities are buying well and railroads are taking about the usual amount. During the week ending Dec. 9 there was an exceptional shortage of cars in the eastern Ohio field.

Prices appear to be giving ground, although domestic sizes are holding up best. Screenings are hard to move in some instances and this aids in maintaining lump prices, as operators are sacrificing slack in many instances.

NORTHERN PANHANDLE

Production is about on a par with that of other parts of northern West Virginia. Mines are unable to work anything like full time owing to the difficulty in securing an adequate car supply, though there is a better supply available since the general movement to the Lakes ceased. Demand for steam has slackened somewhat with railroads getting more coal than any other class of customers. Domestic buying is more active than for any other kind of fuel, though extremely irregular. Lump and egg bring $4.25@$4.75, with mine-run priced at $3@$3.50.

EASTERN OHIO

Output for the short week was 263,000 tons, or approximately 50 per cent of capacity, a decrease from the preceding week of 75,000 tons. It is conservatively estimated that car shortage caused a loss of at least 200,000 tons in output. Railroads are taking between 40 and 45 per cent of the output of eastern Ohio mines.

Cumulative figures indicate that output of this field for the calendar year up to Dec. 2 was 10,007,500 tons, as against a potential capacity of 28,974,000 tons.

Operators and jobbers state that steam demand is less active than in some time. In contrast to the slump in steam demand, inquiries from retail dealers are quite active, as domestic consumers have been able to procure coal only in a small way. However, smokeless fuels from West Virginia and eastern Kentucky are coming through more freely and likewise more Ohio domestic lump is now available than formerly.

Spot prices on steam sizes, which have receded from 50 to 75c. per ton during the past few weeks, are about the same as those quoted last week, namely: Eastern Ohio No. 8 slack, $2.75@$3; nut and slack, $3@$3.15; mine-run, $3@$3.25; ¾, 1 and 1¼-in. lump, $3.75@$4; 2, 4 and 6-in. lump, $4.25@$4.50. Ohio No. 6 or Middle District f.o.b. mine prices as well as coal from West Virginia Panhandle district are quoted at about the same figures.

During the week ended Dec. 2 Cleveland industries and retail yards had the largest receipts on record. A total of 2,495 cars was received, 1,748 of which were consigned to industries and 747 cars to retail yards.

In the Lake trade it is now expected that a good clean-up will be made before navigation actually closes and little coal will be left over at the lower lake docks. Lake shipments up to Dec. 4 were 17,171,965 tons, as compared with 22,385,495 tons during the same period of 1921.

CLEVELAND

Industrials continue to delay buying for future needs, filling only spot requirements. Soft-coal prices generally are 25@50c. lower than a week ago. Buyers in this territory believe that the bottom has not been reached, but producers in northern and eastern Ohio look for an upturn in prices soon.

Retailers assert that delivery cost to consumers is increasing steadily because of piecemeal buying by most domestic users.

Some grades are not difficult to obtain, and since the virtual close of Great Lakes shipping, releasing more than 1,000,000 tons of coal weekly to other channels, Pocahontas is coming into this market in much larger quantities. West Virginia and Kentucky coals have shown a price softening here in the last few days.

DETROIT

Offerings of bituminous coal seem to arouse little interest among buyers for Detroit steam plants or the retail dealers. The waiting policy, long characteristic of the market, is still popular. Wholesalers and jobbers report orders small and irregular. Buyers for the steam plants are ordering only current requirements for a few days' operation. Even with the dragging demand there is virtually no free coal.

A slight improvement in supply of smokeless is reported by some of the jobbers, though the quantity is still far short of normal.

Lack of active interest among steam buyers and retail dealers apparently is based on an expectation that prices will be lower when the Lakes close. Considerable coal is still being loaded for the Lake trade.

Most of Detroit's supply is coming from Ohio. Hocking lump is quoted at the mines at $3.50 per ton, egg $3, mine-run $3 (or) nut, pea and slack $2.75. Pittsburgh No. 8 three-quarter lump is $4@$4.25, mine-run $3.50, slack, $2.50@$3.00. West Virginia and Kentucky lump and egg is $4, mine-run $3.50, slack $3. Southern lump and egg is offered at about $4 with mine-run $3.50.

Northwest

Soft Coal Continues Plentiful and Lower

Volume on Hand Leads Docks to Cut Here and There—Anthracite About Gone and Little More Expected—Rail Embargoes Penetrate Deeper and Deeper.

Further weakness in the price of dock bituminous was evident throughout the Northwest during the past week, especially before a wave of raw cold blew down out of the North about the middle of the week. All shippers have so much on hand and are so pestered by rail coal from the states at the south that they are unloading as swiftly as they can, with little thought for the future except that they are not making future contracts at anything less than circular.

Hard coal is practically exhausted and little more is expected, for the extended navigation season ends Dec. 15. Everybody is prophesying higher prices, but these have not yet made themselves deeply felt. It is to be observed that the battle for markets between docks and bituminous rail shippers is growing steadily stiffer and that rail coal is reaching points a good deal farther north than is customary in normal seasons.

MILWAUKEE

Real wintry weather throughout the Northwest has put life into the coal market, both wholesale and retail. The general public has been strangely indifferent to the abnormal fuel conditions, but the sharp downward turn in the temperature has weakened some country communities. At Green Bay, the State Fuel Commission has been called to investigate a charge that coal-dock operators are discriminating in favor of local residents.

Everything indicates higher prices for anthracite in the near future. A uniform grade has been maintained for years, but now many dealers charge $16.70 per ton for chestnut, carried in while others charge $17.85; egg ranges from $16.50 to $16.25; pea, $16.75; $16.50, $16.45 and $16.30; and nut, $16.20. Soft coal is holding steady. Illinois and Indiana coal is being substituted by many consumers for the higher-priced Eastern product.

Coal is still coming by lake, but not with the expected final rush. Docks seem to have soft coal enough. One cargo of 10,000 tons of soft coal which arrived in the harbor a day or two ago, was sent to Indiana Harbor, Ind. The soft coal received has not been up to the usual standard, it is said, and more prices are right. Anthracite is still coming, however, and late arrivals will extend of hard coal. December receipts thus far aggregate 23,050 tons of anthracite and 15,642 tons of soft coal. This makes the season's receipts thus far 291,502 tons of the former and 1,259,207 tons of the latter, against last year's record of 988,767 and 2,574,374 tons respectively.

MINNEAPOLIS

At last some real cold weather has struck the Northwest, and the surplus steam coal which has been awaiting a buyer immediately took a better standing. All-rail coals from Illinois, Indiana and western Kentucky have been sold in this market at various mine prices, ranging from $1@$2.50 for Kentucky coal up to $4@$5 for Illinois coals. Practically every grade had been selling off from the supposed price until the cold wave braced the market.

The soft-coal market is so completely a weather proposition that producers who send quantities of coal to this market would do well to study the weather predictions before shipping. In many cases demurrage charges run high. One car is rumored to have had a total of $700 against it. The tendency to use this district as a surplus market is making it a less stable one.

Hard coal is certain to be very short with the close of navigation Dec. 15. Something over 400,000 tons of hard coal had reached the docks up to Dec. 1 with little more reported en route. This is some 400,000 tons short of the amount pledged, and will doubtless be reduced somewhat in the few days before the close.

DULUTH

Official figures show that 204,221 tons of anthracite and 1,453,406 tons of bituminous were received at Duluth-Superior harbor during November. This brings the grand total received this year to 736,845 tons of hard coal, 21,875 tons of hard coal screenings and 4,952,594 tons of soft coal. Last year there had been received to Nov. 30, 1,813,336 tons of hard and 8,294,541 tons of soft. Last year, however, the docks were empty when the season started and this year a considerable supply was on hand. By comparing figures it readily can be seen that the Northwest is long on bituminous and short on anthracite.

Receipts are falling off. This week only 36 cargoes arrived, but of these, 8 were anthracite. There are 16 cargoes reported on the way of which 6 are hard coal. The weather is bad, with heavy snow here and it does not seem possible that much more coal will be shipped though the docks have supplies of hard coal to last but 20 days. Most docks here are holding their anthracite for the local trade.

Prices on hard coal remain firm but bituminous shows some weakness, because of the lessening of the market area through orders of the Fuel Administrator. Lump sells for $9.50 still but run of pile is fluctuating between $8 and $8.75, with screenings between $6 and $7. It is worthy of note that docks are not taking contracts for future delivery at less than list.

New England

Market Shows Betterment; Prices Stiffen at Roads

Buying Slightly Improved — Western Demand Attracts Larger Share of Cars—Only Small Tonnages Available for Coastwise Shipment.

Improvement in this territory is by no means conspicuous. A few of the textile mills have bought limited amounts for delivery through the winter, but the aggregate tonnage is not enough materially to affect the market.

Car supply on the Southern roads is still light, and while there is no pressing spot demand, prices have again stiffened somewhat at the piers. Western demand for prepared coal is strong enough to attract the larger share of cars, and in consequence there are only small tonnages available for coastwise shipment. At the same time contract requirements are being met with little or no delay.

For inland delivery $9.25 has been paid per gross ton on cars Boston, a price that compares with $7.75 f.o.b. vessel at Norfolk or Newport News, but as an average quotation this has been shaded within a few days. On-car prices in excess of $9 open a little wider the gate for deliveries all-rail from central Pennsylvania.

The Cambria and more favorably known Clearfield grades maintain a reasonably steady position with respect to price and shipment. Most operators with good connections are able with reduced car supply to keep orders ahead for two to three week period, and while prices show no signs of hardening for the present the mines are able to operate in most cases without reducing their asking price.

Receipts all-rail have diminished the past fortnight, but this is probably due more to reduced shipments of locomotive fuel than to any marked decrease either in buying on the part of industries or to any slowing up of shipments on contract.

There continues fairly constant inquiry for prepared bituminous to take the place of anthracite. In the smaller cities, and in some towns, the great shortage of anthracite has at last induced householders to take small quantities of such bituminous as can be had. A few operators in the Broad Top district have been able to do a flourishing business on screened egg and chestnut sizes at prices far more remunerative than if they were restricted to their normal steam coal trade.

Cincinnati Gateway

Disarrangement of Traffic Nears the Scandal Stage

Situation Upset on Three Roads from South—Collusion to Hold Back Output Inferred—Business Picks Up—Tone More Stable.

Traffic conditions on the three coal carriers using the Cincinnati gateway from the South are fast reaching a point that causes eyebrows to raise and scandal to pop. The Norfolk & Western seems to be in the worst plight, the Chesapeake & Ohio is a little better off, but on the Louisville & Nashville things have come to such a pass that various of the operators' associations have had meetings with those who direct its affairs and they have placed the burden at the door of the shopmen's strike. By inference also it would seem that there is collusion somewhere to hold back production through the channels of transportation so that in the event of trouble April 1 these great producing fields will not have their share of coal above ground.

Business picked up a bit last week. The tone of the market was more stable. Moderate buying by steel plants and byproduct users helped some and the colder weather also deserves a share of credit.

LOW-VOLATILE FIELDS

New River and the Gulf

As a great many mines are not working more than a day a week, the field as a whole cannot even handle contract orders promptly, leaving little or no free coal to be disposed of in the open market. Not a large proportion of the output is being shipped to Western markets, since equipment is not to be had. Furthermore demand has improved at Tidewater, where prices are attracting larger shipments, the prevailing price being about $5.25 a ton. Prepared grades in the Eastern and Southern markets are bringing from $7 to $7.50.

There has been a slight improvement in transportation conditions affecting the Winding Gulf region. Virtually all the tonnage is going to Tidewater, since the western outlet is restricted. The price, too, is on a higher level, with mine-run bringing over $5 a ton.

Pocahontas and Tug River

Distribution of empties is not now equal to more than 40 per cent of allotment, so that few mines are operating more than two or three days a week. There is an increase in the movement to Tidewater, where prices are on a somewhat higher level, the ruling price at the piers on a spot basis being $5@$5.25.

In view of the fact that so large a proportion of the tonnage originating in Tug River territory is marketed in the West the difficulty in obtaining equipment to transport Tug River coal to western markets is being seriously felt. Prepared grades, being scarce, are bringing high prices, with $8.50 the maximum, in some parts of the West.

HIGH VOLATILE FIELDS

Kanawha

Car supply has improved of about 5 per cent as compared with previous weeks. Mines are able to work two days at best and many only one day a week. Therefore a waning demand has exerted less effect than might otherwise have been the case, for output barely suffices for regular customers. Tonnage to be had in the open market is not large nor is it bringing as high a price as it did. Steam mine-run ranges $3 @$3.75. Restricted use of the larger cars of the C. & O. is tending to throw more Kanawha coal to Eastern markets.

Logan and Thacker

Because of the failure of the C. & O. to furnish anything like an adequate car supply, this district is not loading more than 160,000 tons a week. The falling market has not had any adverse affect on the region as a whole for the simple reason that there is little or no surplus coal to be had in the Logan region. What little coal there is moving on a spot basis is of course bringing lower prices, especially in so far as steam mine-run is concerned.

Conditions in the Kenova-Thacker field are much the same as in other fields served by the N. & W., with mines limited to two and three days a week because of poor car service. Western equipment is used almost entirely by the Thacker field since nearly all the coal originating in this territory is marketed in the West. Production is scarcely more than equal to the needs of regular customers, so that a declining market and softening prices has not affected production so far.

Northeast Kentucky

With production not over 100,000 tons per week, or about 27 per cent of potential capacity, there is little coal to be had over and above that needed to take care of standing orders, so that prices obtaining in this territory are somewhat higher than those in the general market. Lump is bringing $6 a ton and mine run $3.50@$4.

CINCINNATI

The smokeless market has been pretty well riven to "sixes and sevens" through the traffic difficulties. With tide prices $1.50 a ton below those of this and the market inland the movement west over the N. & W. since the middle of November has been a minimum for Pocahontas coal. That from New River has been of no great tonnage and what has fallen into the hands of the jobbers has been held at prohibitive prices.

After a drop of considerable proportions the steam market took a brace under better buying and both slack and mine-run made a slight recovery. Domestic sizes are holding their own, though there is a disposition to grant concessions in price.

With 60,000 tons of river coal placed in the local harbor the retail trade served by companies handling it again became a potent factor in this angle of the business. One firm is selling its splint lump at $8.75, while all-rail brings up to $10. Buying from brokers has forced the price on Pocahontas lump up to $11 with mine-run bringing $9.75@$10; bituminous slack is quoted at $7.50.

Coke

CONNELLSVILLE

The coke market has gone contrary to expectations, as prices have been softening and production is being curtailed at some points from lack of demand.

The spot furnace coke market, quoted a week ago at $7.25@$7.50, is down to $6.50@$7, while shipment over the balance of the year can be done at $6.75@$7, against $8, formerly demanded. Foundry coke is off; at the former range of $7.50@$8.

The *Courier* reports production in the Connellsville and lower Connellsville region in the week ended Dec. 2 at 121,000 tons by the furnace ovens, a decrease of 7,350 tons, and 77,770 tons by the merchant ovens, an increase of 20 tons, making a total of 198,770 tons, a decrease of 7,330 tons. These are the first decreases since the strike started, except early in July.

UNIONTOWN

With several thousand former miners still on strike operators have been forced to cut production with new labor, as they see no market for their product. The closing of the Great Lakes trade left a big gap in the destination of Connellsville coal and operators have not been able to make arrangements for the delivery elsewhere.

Consumers are buying extravagantly. Prices for steam coal continue at the $2.25@$2.50 level with byproduct at $3@$3.50. The cost of output is approaching too near the market to be comfortable.

Practically the same condition prevails as regards coke. A limit of $7 apparently had been placed upon furnace coke by a number of operators and they now have their choice of revising their price views or suspending. The market has definitely dropped to $6.25 and $6.75 and even at that figure furnaces do not care to buy heavily.

BUFFALO

The demand for coke, especially for domestic purposes, is good. The local ovens do not get any surplus for the merchant use, so that it all has to come from some other source. The use of coke in place of anthracite is increasing and that keeps prices up. Jobbers quote 72-hour foundry coke at $7.50@$8, furnace at $6.25 and stock at $6, with domestic sizes at $9 and $10, adding $1.75 for freight.

News Items From Field and Trade

ALABAMA

James D. Strong, one of Ore killed and [illegible] in the Birmingham district, who for the last 18½ years has been general superintendent of mines for the **Alabama Company**, has been elected to a vice-presidency in that corporation and will have jurisdiction over the administrative and operation of the physical properties.

ALASKA

A fire which started Nov. 20 in the **Evans Coast** coal mine on a spur of the Alaska G.E. and is still burning has brought Anchorage fuels to face with a fuel famine. Every available lump and three cubic yards have been transported to the city to tide over the winter and get coal from it to the railroad.

CALIFORNIA

Announcement of the **McCormick Steamship Co.** of Los Angeles as Pacific Coast representative for the **Coolmer, Curran & Baillie Co.** of New York, is bringing another big fuel coal line into the [illegible] trade. Eight steam schooners, ranging in size from 4,000 to 12,000 tons deadweight, are owned by the company, and most, if not all, will be pressed into the new service. Under the scheme of operation the vessels will carry coal from North Atlantic ports to the Pacific Coast, returning to the Atlantic seaboard with Pacific Coast lumber. The principal Pacific Coast [illegible] to receive the first cargo. It is expected that most shipments from the East coast will be consigned to Los Angeles from there on.

COLORADO

A cave-in at the Fox mine near Cripple Creek, in which Superintendent Baldwin, a miner and two shovelers were at work, caused the loss of 5 hours and 12 minutes [illegible] a pinning partition. The men freed themselves and were [illegible] and with no injuries except a severe shock. The outstanding fact due to the falling of timbers in such a position that they rode down on a mine car and although the accident itself was [illegible] shows what the men up in the stope beneath were [illegible]. When everyone, digging through the 24 ft. of [illegible] at the point of the cave-in had worked frantically for six hours they [illegible] and were astonished to know that he was alive. After [illegible] the physician removed a heavy rock from one of his legs and took him to safety. This is the third cave-in at the Fox mine within a short time.

Gross receipts of the Colorado Fuel & Iron Co. for the [illegible] ending with September were $1,244,961, an increase of $[illegible] over those for the corresponding period in 1921, operating expenses were $[illegible] larger than during the 1921 [illegible] totaling $4,378,491. From the [illegible] were $[illegible], while in the [illegible] they were $[illegible]. Other [illegible] brought the total gross [illegible] to $[illegible], not after taxes, [illegible] $[illegible] compares for the [illegible] $[illegible] in the fiscal months and [illegible] $[illegible]. The [illegible] for the [illegible] were $[illegible], while [illegible] $[illegible], and [illegible] $[illegible] on account $[illegible] [illegible] the [illegible] for the [illegible] $[illegible] larger than the [illegible] for the same period last year.

The Royal Fuel Co. [illegible] to operate [illegible] Colorado.

ILLINOIS

The claim of the city of St. Louis against the St. Clair Coal & Mining Co. arising out of the short weight frauds at the city water works from 1911 to 1921 for $9,000 has been settled for $7,000. J. M. Brickler, secretary of the coal firm, who turned state's evidence paid $15,000 for his interest in the firm in the settlement. This action has no effect upon the present sentences of two years each against M. L. Rosenheim, city weigher, and Edwin F. Kleine now out on bond, and F. W. Kleine, yet to be tried.

Five hundred children of coal miners at West Frankfort who had no public schools for sixty days resumed school duties Dec. 3. Local differences in that coal-mining community defeated the bond issue for $64,000 for teachers' salaries.

Earth tremors lasting several minutes were felt at 9:30 p.m., Nov. 27, over the greater part of the southern Illinois coal fields. At places chimneys were toppled over, but no damage reports from mines are in.

Plans are under way to organize a company to construct a 16-in. water main from the Mississippi River near Grand Tower to Christopher in Franklin County, by the way of Murphysboro, Carbondale and Herrin. This would go through the center of the Jackson, Williamson and Franklin County coal fields and is approved of by the leading business and coal men in southern Illinois. This might eliminate for all time the scarcity of the water in the coal belt. It is expected that an expenditure of $10,000,000 would be necessary for equipment to pump 7,500,000 gallons of water daily. The railroads in southern Illinois also might get water from this main, which would lie on private right of way.

In a "safety first" week just ended at No. 2 mine of **Donk Bros. Coal & Coke Co.** at Maryville a record of **no accidents** was established for the first time in the 20 years of operation for that mine. Heretofore accidents per week were from 10 to 15. The mine employs 550 men. **William Vanline** is manager and **Clarence A. Naern**, safety engineer. A similar campaign is scheduled for the Edwardsville mine.

The Chicago Trust Co., through J. W. Marshall, manager of its bond department, denies that it is in any way interested in any bond issue of **The Sunnyside Mining Co.** of Herrin, and that no trust deed for a bond issue by that mining company has been filed with it.

Silas Shafer, president of the Assumption Coal & Mining Co. of Assumption, is recovering satisfactorily from the effects of an automobile wreck in which he was caught. Mr. Shafer's machine turned over, breaking his left arm. Having suffered five arm breakages during his life, Mr. Shafer takes such things as matters of course.

Coal was struck recently in the new mine located near Cantrall, Sangamon County, owned by Sidney Grant, Frank Boyer and Henry Strode. The vein which was found to be 8 ft. thick was struck at a depth of 720 ft. Sinking had been going on since early last spring. The mine is served by the Chicago & Northwestern railroad and will be equipped with modern machinery and ventilation.

E. L. Berger, [illegible] of the Bell & Zoller Coal Company, Zeigler who underwent a serious operation in a Boston hospital recently has recovered and is back at work.

Fifteen thousand acres have been prospected for coal near Hamel. As a result a W. Crawford, of Carmiville, acting as a representative of St. Louis capitalists, is buying coal lands. About $[illegible],000 has been paid out in cash to the farmers in the last ninety days.

INDIANA

The American Coal Mining Co., at Brazil, Ind., has filed a preliminary certificate of dissolution with the secretary of state.

The car situation in southern Indiana, especially with the mines in the region served by the Southern Railway, **is improving**, according to Harry W. Little, manager of the Southern Indiana Coal Bureau. During a recent week the 16 mines along the road received 53.5 per cent of the cars ordered. A total of 1,631 empties were ordered. Forty-eight cars were furnished by the E. S. & N., 881 by the Southern and 143 by the Big Four railroad. The mines were able to operate about 47.2 per cent of the potential running time. It is believed it is only a question of time until the mines will be receiving 100 per cent of cars ordered.

A trust deed for $150,000, drawn by the **Lemaire Coal Co.** and in favor of the Aetna Trust and Savings company of Indianapolis, has been recorded. The coal company, whose home is in Terre Haute, did not set out any specific use to which the money is to be put. Its lands in Greene County were given as security.

IOWA

The Whitney Coal Co. of Des Moines has been incorporated with a capital stock of $15,000. The following are the officers: George E. Whitney, president; C. W. Rhoads, vice-president; A. S. Burnette, secretary; and James H. Deemer, treasurer. These men form the board of directors with Fred W. Evans.

KANSAS

The Oklahoma coal field near the Kansas line, which was opened last year, has spread into Kansas and promises to bring a new industry into this part of the state. **The Central Coal & Coke Co.** has been acquiring leases in Labette County near Edna.

Lon Mitchell, a farmer living near Englevale, in this county, dug up dirt on a public road near his place to get at coal that was underneath. A warrant was issued at the instance of C. M. Cooper, county engineer, ending the project and Mitchell will have a trial soon at Girard, Kan.

KENTUCKY

Kentucky production this year should exceed the mark of 31,588,270 tons reported for 1921, in a Geological Survey report released a few days ago. During the early days of the coal strike Kentucky ran practically full, and piled up a big tonnage increase, which will make up, to a considerable degree, for the car shortage. The L. & N. had some months this year which exceeded any previous months in the history of the road. All told, production this year has been very good, in spite of the complaint of operators, and indications are for larger tonnage showing.

The Inland Waterways Co., a $2,000,000 company, formed some months ago, **has started work on combination rail and river terminals** at the east end of Louisville and is having conveyor equipment built for use from a floating dock in unloading cargoes of coal, merchandise, etc. The company is having a number of steel barges built and is towing a good deal of coal from its Kentucky River mine subsidiaries to Louisville when open water permits.

W. D. Beerman, of Nashville, Tenn., **has** joined the sales force at the **Dixie Coal Co.**, Louisville. **Manager Harry H. McBratney**, of the local office, has been spending a few days at the Chicago office of the company.

The Falls Branch Coal Co., Louisville, capital $70,000, has been chartered by **Powhatan Woolridge**, of Pewee Valley, C. F. Woolridge, Louisville, and J. P. Woolridge, of Woolridge, Tenn., for the purpose of owning and leasing coal and timber property and mines.

Frank Sneed, of the Harlan Coal Co., recently was elected vice-president of the Pendennis Club, of Louisville, one of the oldest and finest social clubs in the South.

The Madisonville Coal Properties Co., of Madisonville, has been incorporated with a capital of $100,000. The incorporators are J. B. Ramsey, B. C. Mitchell and R. H. Gatton.

MINNESOTA

The shortage of hard coal to the Lake Superior docks is seriously disturbing the coal commission of Minnesota, which has been struggling to induce a rushing forward of additional cargoes, but with limited success.

MISSOURI

Sam Reftt, 79 years old, who has been digging coal for 68 years and who is good for several more years in the mines, believes that his record is the best in Missouri and that it would be hard to equal in any part of the United States. He declares that he can still do as much work as any man and his pay checks bear him out. He was born in Brazil, Ind., but has lived in Bevier 73 years. Reftt declares that he once dug coal for 50c. per ton and mined it on the bench. He has been a member of the United Mine Workers ever since its organization. When he joined, the initiation fee was 25c. He also remembers when the coal companies compelled the miners to buy all of their supplies and provisions from the company store. He never has had an accident in the mine during his long career and is an advocate of plenty of hard work, declaring it does not hurt anybody.

A company formed at Sedalia has **leased the George Penrod farm,** near the Pettis-Johnson county line, where mining for coal will be started at once. The company is made up of Pettis and Johnson County stockholders. The construction of a switch from the main line of the railroad has been completed.

The Missouri-Kansas Coal Co. has been incorporated with $10,000 paid in to operate a coal mine at Worland.

OHIO

A dozen towboats left Dam 26, near Gallipolis, at noon Wednesday, Dec. 6, for Cincinnati, with 60,000 tons of coal for distribution to dealers. Nine other boats left Huntington, W. Va., Tuesday, with 35,000 more tons for Cincinnati, according to J. A. Reilly, manager of the Queen City Coal Co. With these two shipments the market will be supplied for about 10 days, Reilly said, and more shipments will be forthcoming soon. The river, he said, is in excellent condition for navigation.

Bids will be opened Dec. 21 by R. W. Smith, clerk of the Board of County Commissioners of Columbus, for 100 tons of lump or mine-run for the Court House; 2,000 tons of the same kinds of coal for the county infirmary and 500 tons for the Memorial Hall. Coal for the Court House and Memorial Hall must be delivered while that for the County Infirmary is to be placed on the infirmary switch.

Steps are being taken by the newly incorporated **Caledonian Coal Co.,** of Columbus, **to sell its mining property** near Nelsonville. The company was chartered with a capital of $50,000 by James Williamson, George Williamson, E. M. Blower, Charles Wallace and John Williamson. The property consists of 400 acres with a working mine.

It is unlikely that any coal will be purchased by R. V. Johnson, Superintendent of Purchase of Ohio, on bids received Dec. 1 for supplying approximately 125,000 tons of coal to the various state institutions under the Department of Welfare. The bids ran too high, according to Mr. Johnson. Low bids at the mine for Hocking nut, pea and slack were $2.39 and for mine-run $2.99. It is believed that bids will be called for again about the first of the year.

If the estimate submitted to Congress, in the annual report of Major General Lansing H. Beach, Chief of Engineers, U. S. Army, is approved, $7,000,000 will be available in the fiscal year 1924 for the continuance and completion of work upon the locks and dams under construction in the Ohio River at the close of the present fiscal year. The financial summary of the Ohio River lock and dam project contained in the report shows that total appropriations to date amount to $72,196,579,178, of which $65,737,290 has been expended on new work. The amount expended on new work during the fiscal year ending June 30, 1922, was $4,481,101, leaving an unexpended balance of $6,450,289.

A new coal road, which will result in the development of **thousands of acres of coal land lying west and north of Steubenville,** in Jefferson County, will be built by the Cleveland & Pittsburgh division of the Pennsylvania R.R. Permission to construct the tracks across the county highway north of Steubenville has been granted by the County Commissioners and negotiations have been commenced by the company for the purchase of a strip of city property needed for the right of way.

Inasmuch as the order of attachment in the case of **Harvey Sipe against the United Mine Workers of America** has been quashed by the Circuit Court of Harrison County it has now become possible to pay over to the union the proceeds of the check-off collected in Harrison County, W. Va. As long as the order of attachment was in force, coal companies in Harrison County were forbidden to pay any check-off funds to subdistrict officers. The ruling releases between $5,000 and $6,000 in check-off money. Sipe sued the union when it refused to enter into any contract with him for the operation of his mines, because the mines belonged to the Hudson Coal Co., which has refused since the end of the strike to make an agreement with the union.

PENNSYLVANIA

Additional tank trains have been placed in service recently in hauling water from the Susquehanna River at Sunbury, twenty miles distant for use at collieries at Shamokin, where **production of anthracite is being gradually curtailed as a result of the acute water situation.** Several large industries operating their own power plants were forced to shut down a majority of their boilers, continuing only sufficient for heating purposes and are purchasing power transmitted from Hauto, forty miles distant.

A conference of official representatives from all cities, boroughs and townships in the anthracite region at Wilkes-Barre, Dec. 14, has been called by the Wilkes-Barre City Commissioners. The conference is to discuss proposed legislation which would give the anthracite region municipalities a fair share of the tax on anthracite to repair damage to roads and other public property caused by mining operations and for other municipal purposes.

Actual work on the **erection of a mammoth power plant** at Springdale by the **West Penn Power Co.** in addition to the large plant now being operated, will begin within a few weeks, according to A. M. Lynn, president of the company. The financial outlay, according to Mr. Lynn, will exceed $6,000,000, and the new plant will be much larger than the present one. When the present plant at Springdale, one of the most modern and complete power plants in the country, was erected, provisions were made for the enlargement, which will soon be under way and which, when completed, will multiply its capacity several times.

Coal miners of the country are being assessed to liquidate a $1,000,000 loan incurred by the United Mine Workers of America in the last strike, according to assessment notices in the Wilkes-Barre district. Thomas Kennedy, president of District No. 7, U. M. W. A., has sent out the following notice: "During the six months' strike in the anthracite and bituminous regions the organization was compelled to borrow more than $1,000,000. In order to secure the loan of this money every international office of the United Mine Workers of America, including the national board members, who owned real estate or any property, mortgaged his home and property as collateral. This money helped to win the strike and made it possible for the mine workers to enjoy and hold their old conditions and rates of wages, and this money must now be paid back and our obligations liquidated."

A banquet in honor of the members of **the mining department helmet team of the Cambria Steel Co.** was given recently by company officials. Each member of the team was presented with a watch as a tribute to the valor of the men in rescuing fourteen entombed miners at the Reilly mine at Spangler on Nov. 6, when seventy-seven men lost their lives. About fifty men attended the banquet. The watches were presented by L. R. Custer, vice president in charge of operations, to the following members of the crew: Edmund Williams, David Malcolm, William A. Thomas, George Winder, Paul Smolnik, Richard G. Lewis, Owen Robertson, Arthur Schallenberger, Fred Smith and Joseph Martin. Mr. Custer praised the men highly for their efficient service and reviewed the work of the helmet crew in other mine disasters.

C. F. Ingold, vice president of the Berths Coal Co., Pittsburgh, has just returned from a western business trip during which he visited with T. P. Jones, resident manager of the company at Cleveland and Vaughn J. Jolliff resident manager of the company at Detroit. Mr. Ingold reports the prevalence of healthy business conditions and while there is a great shortage of cars sufficient equipment is available to move all the coal required.

UTAH

The Columbia and Pacific Steel companies, which recently entered the Utah field, are to **merge their interests.**

The case of the United States vs. the State of Utah and the Pleasant Valley Coal Co., involving the question of the known quantities of a tract of land in Carbon County in 1896 the year in which Utah was admitted to statehood, is to be reopened. The state held the land to be coal land, but Mark P. Braffet, later sold application to the federal authority for the land, believing it belonged to the United States. The case is an old one and the question to be decided is: **Was it known that the land contained coal on Jan. 4, 1896 when Utah become a state?** The Secretary of the Interior has ruled that the point in question might be determined by geological inference rather than from the actual exposure of a seam of coal.

R. V. Gibson and **N. M. Madsen** of Madsen Bros. are opening up a new mine about one mile south of and above Scofield on Clear Creek, branch of the D. & R. G. W. R.R. It is expected that shipments will be made on or soon after Jan. 1.

WASHINGTON

T. E. Doremus, who for the past three and a half years has represented E. I. du Pont de Nemours & Co. as general eastern manager for the Orient, with headquarters at Shanghai, China, has returned to the United States. Mr. Doremus is now located at Seattle, where he is manager for the explosives department of the Du Pont company.

The **Pacific Shipping & Fuel Co.,** of Seattle, has increased its capital stock from $75,000 to $100,000.

WEST VIRGINIA

The property, plant and assets of the **Mason Coal & Chemical Co.,** with its extensive coal holdings in Mason County, have been acquired by **J. K. Oney,** a Huntington operator, associated with others. The purchase price is said to be $[illegible]. Included in the purchase are between [illegible] acres of coal land. Others interested with Mr. Oney in this property are S. A. [illegible] of Charleston and John D. Smith of Hamlin. After being closed down for nearly a year it is understood that the mine will be reopened by the new owners after improvements have been made.

Charleston people have just chartered the **Colgate Coal Co.** which will operate in southern West Virginia [illegible] territory. Charleston is to be the general headquarters of the company for a time. The enterprise is capitalized at $[illegible]. Among those interested in it are A. L. [illegible] C. Pauley, M. D. Hill, [illegible] Nathan all of Charleston; A. W. Phillips of Blakeley.

Coal lands in the [illegible] section of Monongalia County are to be developed by the **Indian Hill Coal Co.** just organized with a capital stock of $[illegible]. The officers of the company are to be at Morgantown. Having an active part in the organization were Samuel J. Jones, Jr., C. H. Jenkins, Hugh M. Bradford, James E. Greene and C. H. Humphreys of Morgantown.

Said to be the **first shipment of coal** coming down the Ohio River from mines on the Allegheny River [illegible] tons in tow of the Steamer Transport **passed through Pt. Pleasant,** during the closing days of November destined for the Portsmouth mill of the Wheeling Steel Corporation. The Transport is said to be the largest towboat on the Upper Ohio having been recently secured from the War Transport Co. by the steel corporation. This boat will be used regularly to tow coal from the mouth of the Kanawha to the Portsmouth plant.

Suit has been instituted in Mercer County growing out of a controversy over three cars of coal furnished by the **Blue Flame Coal Co.** to **C. W. Otto** of Pittsburgh, who in turn had a contract with the **Bertha Coal Co.** The suit in this case brought by the Blue Flame Company is against the Bertha company. Otto according to an agreement signed in May, 1922, was to furnish the Bertha company [illegible] tons of coal within a period of 90 days the price being $2.75. The Bertha company in its answer alleges that there was no meeting between it and the Blue Flame company and that the three cars purchased by Otto from the Blue Flame company were purchased of the latter by the Bertha company.

There was a toll of 11 deaths in connection with the production of coal in West Virginia **during the month of October.** 11 of the fatalities being due to the use of coal and coal. There were seven deaths at the result of mine explosions. Mine [illegible] explosions took a toll of [illegible] lives and were fatal to [illegible]. Fourteen of the fatalities were in Kanawha County but there were six each in Logan and Raleigh counties.

John L. Newell of Bluefield, W. Va., president of the National Association of Coal Operators and the **Norfolk-Tidewater Association** in an address [illegible] coal miners were [illegible] with high prices, commented a condition which would [illegible] to the [illegible] of the Bituminous coal [illegible] by reason of [illegible] activity.

CANADA

The Company of Pioneers of Calgary, Alberta, during the last two years has purchased 12 **Alberta has held the premier** position among the coal-producing provinces of Canada, with Nova Scotia, the former holder of this honor, second, and British Columbia third, with Saskatchewan and New Brunswick following in order.

This appeared to have been caused by the **International Coal & Coke Co.** mine at Coleman, near Lethbridge, in the early morning hours of [illegible]. The damage is estimated at $[illegible], and it will be at least a month before it will be possible to resume the mining operations. The origin of the fire is unknown. T. Mackie, who rendered considerable assistance in fighting the fire, says it was evident that the building could not be saved, and went into the mine to get their helmets and has not been seen since.

Fire of unknown origin destroyed the boiler room, washrooms and other buildings of the Dunsmuir mine in the Cardiff coal fields, twenty miles north of Edmonton, Alta., during a strike of coal miners in the province. A building boom was noted in various offices of Toronto. The financial loss could not be estimated. All the mines in the Cardiff district are closed. The Grand Carbonet Company's shaft in the district [illegible] a mine explosion. [illegible] It is believed a month's [illegible] before the operations can be resumed.

Coal shipments for the British Empire Steel Corporation, Sydney, N. S., for the St. Lawrence Market have been **closed for the season** with the unloading of the last cargo [illegible] at Levis. The total shipments for the season amount to [illegible] tons. The largest total for any previous year was in 1914, when 5,800,000 tons were moved on the river from Cape Breton.

The Sun [illegible] Alta., government [illegible] E. J. Roberts, manager of the Drumheller coal mines, and Hiram Irvine, [illegible] were **suffocated by gas** in the Drumheller mine, Calgary, Alta. The [illegible] were smouldering and the men had gone into the mine to ascertain if it was safe for the fire fighters to enter and fight the fire.

WASHINGTON, D. C.

The outcome of the budget has approved proposed **expenditures of $8,358,790** to be made during the [illegible] fiscal year **by the U. S. Geological Survey and the Bureau of Mines.** The greater part of that sum will be expended on work of direct concern to the mining industry. The budget carries $[illegible] for the Geological Survey and $[illegible] for the Bureau of Mines. In each case this represents an increase over the amounts appropriated for the current fiscal year.

The principal items proposed for the Geological Survey are as follows: For the preparation of reports on the mineral resources of the United States, $124,250; for geologic surveys, $[illegible], an increase of $[illegible] for the clerical staff, supplies, traveling expenses and printing, $324,600; for topographical and physical researches relating to the geology of the United States, $[illegible] for preparation of illustrations, $[illegible] for work on the mineral resources of Alaska, $75,000, for engraving and printing geologic maps, $110,000; for gaging streams and determining the water supply of the United States, $179,500; for the classification of lands, $200,000, an increase of $75,000.

The principal items comprising the appropriations of the Bureau of Mines follow: For mining experiment stations, $175,000, an increase of $[illegible], for mineral-mining investigations, $125,000; for investigations of mineral fuels, $116,000, an increase of $[illegible], for operating mine-rescue cars, $[illegible], for investigations as to the causes of mine accidents, $393,000, an increase of $[illegible] for clerical help and general expenses, $78,700, for inquiries and investigations and dissemination of information concerning the mining, preparation, treatment and utilization of petroleum and natural gas including economic conditions affecting the industry, with a view to economic development and the conserving of resources through the prevention of waste, for enforcement of the Leasing Act, for enforcement of laws relating to leases on Indian lands and naval petroleum reserves, $[illegible], for supervision of coal and mineral leases, $[illegible], for mining investigations in Alaska, $[illegible], for the purchase of 78 acres of land at Bruceton, Pa., now occupied by and adjacent to the buildings and equipment of the explosives testing station and experimental mine of the Bureau of Mines, together with 10 acres of unmined coal, $33,000.

The budget includes substantial additions to cover the leasing work being done by the Bureau of Mines. This includes the expense of furnishing technical supervision over leasing on Indian lands. This responsibility has rested with the Bureau since Secretary Fisher's day, but it was necessary to take from other appropriations for this work. The need of making this inspection more systematic has become apparent and a special fund is being asked. An increase has been allowed so as to permit the purchase and operation of equipment for investigating liquid oxygen. Another increase provides for the study of a classification of coals by use. In addition, it is expected that other substantial sums will be available to the Bureau on transfer from the Navy for work on naval petroleum reserves and from both the Army and Navy for work on helium and for testing explosives.

The appropriations asked for but not allowed by the Director of the Budget include that providing for a field testing station for oil shale work and for its operation for the first year. The Director of the Budget also reduced the amount requested for the bureau's leasing work and it probably will be necessary to ask for a deficiency appropriation, especially for the coal leasing work. To meet that emergency the Secretary of the Interior has authorized the temporary transfer to the Bureau of Mines of several of the field agents of the Land Office.

No appropriation was asked for new mine-rescue cars. The cars appropriated for last year are nearing completion and will be available for service after the first of the year.

The Government Fuel Yard is now operating on a basis which will permit of a reduction in the revolving fund from which coal purchases are made. This reduction was requested by the bureau.

Kingman Brewster has been made chairman of the committee on appeals and review of the **Bureau of Internal Revenue.** Mr. Brewster has been serving as special attorney for the Bureau in the office of the solicitor.

Traffic News

Complaint has been filed by the **Capen Fork Coal Mines** against the C. & O. with the public service commission of West Virginia, to [illegible] locations in Braxton County, the complaint being that such facilities are inadequate and do not permit of the prompt handling of the product of the company.

An **[illegible] embargo** exists on the line of the C. & O. because of the [illegible] by fire of a large [illegible] and [illegible] the C. C. C. has ordered that effective Nov. 17, the C. & O. furnish [illegible] cars to the **Elkhorn Piney Coal Manufacturing Co.** at Weikbury, Ky., for the loading of coal now in stockpile at the rate of 50 cars per day for each [illegible] working day until a total of 500 cars are assigned. The cars so placed shall be counted against the [illegible] according to the rules.

Canadian roads having withdrawn their **[illegible] freight charges to the border** on coal and coke from United States mines in Canadian destinations must be prepaid. However, efforts are arranging to secure these allowances [illegible] and after Dec. 15 1921 will cease to collect.

The Missouri Pacific R.R. is an [illegible] the C. R. Speer and the I. C. C. is [illegible] to operate in the State. Ark. coal will take 40 coal cars [illegible] to relieve the pressure for [illegible] to western Missouri and Iowa, [illegible] Kansas and Illinois, [illegible] the purchase of Pennsylvania hard coal.

An effort to increase the first zone coal freight rate was resisted by Northern West Virginia coal shippers when that question came up for a hearing before representatives of the Interstate Commerce Commission in connection with the case of the Pittsburgh Coal Co. against the B. & O. et al. The present rate is 7c. per ton [illegible] Wheeling and the proposal is to increase the rate from 7c. to 10c. a ton. West Virginia shippers claim that Pennsylvania producers are [illegible] the improvement in [illegible] rate increases and have retained [illegible] to operate. Quite a few [illegible] have been sent to [illegible].

Beginning Dec. 1, consumers of coal in Terre Haute and other cities in the Wabash valley were affected favorably by a recent ruling of the Public Service Commission carrying a **10 per cent reduction in the Indiana short-haul coal rates** for distances of thirty miles and less. The reduction was ordered as a result of a complaint filed by the Terre Haute Chamber of Commerce, which was heard by the Public Service Commission Aug. 31. The local chamber was represented by W. M. Myers, general manager of the Highland Iron & Steel Co., and vice chairman of the executive traffic committee; Samuel Royse, W. S. Blauvelt, president of the Indiana Coke & Gas Co., and R. I. Pierce, traffic manager of the local chamber. If the rates had not been [illegible] the cheapest rate on coal into Terre Haute would have been 89c. a ton instead of a minimum of 50c. a ton. As approximately 1,000,000 tons of coal are consumed by Terre Haute industries yearly, a saving of more than $300,000 a year will result.

Association Activities

Northern West Virginia Coal Operators Association

A conference between directors of the Northern West Virginia Coal Operators Association and executives of the Baltimore & Ohio Railway was held at Fairmont late in November, officials of the railroad making a special trip to Fairmont to go over the transportation situation with the operators. A. Dale Watts, of Clarksburg, president of the association, acted as chairman of the meeting. C. H. Jenkins, of Fairmont, former president of the association, acted as spokesman for the operators and presented their grievances which had been incorporated in a statement prepared by Secretary George S. Brackett. Former Governor J. J. Cornwell, [illegible] general counsel of the road and C. W. Galloway, vice-president of the road reviewed at length the conditions responsible for the shortage of equipment and told of the [illegible] of marked improvement.

Obituary

John Dolan of the United States Fuel Company died recently in a Gary, Ind., hospital where he had been confined for over three years. Dolan was assisting in paying off a large payroll at the Middle Fork mine near Benton, Ill., June 27, 1919, when five bandits drove up and shot him without warning, one bullet taking effect in his spine. He was rushed by a special train to a St. Louis, Mo., hospital but never regained health again. One of the bandits was instantly killed in the skirmish while running to his car while the other four were duly sentenced to the penetentiary. Dolan was a man highly respected by all who knew him.

John Martin Rowe, who has been connected with the operations of the Yolande Coal & Coke Co., Yolande, Ala., for a number of years, died Nov. 26 as the result of a stroke of apoplexy. He was well known in mining circles. Mr. Rowe is survived by one daughter and three sons, one of whom is Edgar J. Rowe, of the coal sales agency of Adams, Rowe & Norman, Inc.

George Crooks Silcott, aged 58, president of the **G. C. Silcott Coal Co.**, with offices in the Brunson Building, Columbus, died rather suddenly at his country home at Worthington, a suburb of Columbus. He had been a resident of Columbus for seven years, coming from Nelsonville, where he was interested in the operating end of the coal business for twenty years. He was born in Ravenswood, W. Va. He leaves a widow and a son, Gordon R. Silcott.

Coming Meetings

American Engineering Council will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 22 NEW YORK, THURSDAY, DECEMBER 21, 1922 Number 25

The Important Point In the Anthracite Tax Decision

BY ITS decision in the Pennsylvania anthracite tax case the United States Supreme Court has permanently settled the question of whether anthracite is coal or something else. It has long been a matter of concern to the coal people that the consuming public would not differentiate between the product of the mines in that tight little community known as the hard-coal region and the product from the multitude of mines scattered elsewhere over the United States. So different are the conditions surrounding the mining and marketing of anthracite from those for bituminous coal that what can be said with respect to the one cannot be said with respect to the other. To keep the public from mixing them up in its thinking has been a task as yet wholly unsolved. The low mine price (usually) for soft coal and the high delivered price for anthracite have troubled the uninformed and caused a world of doubting on the subject of mining profits.

The Supreme Court sets the matter forth in clear language. "The difference between them is a just basis for their different classification; the differences are great and important. They differ even as fuels, they differ fundamentally in other particulars." Thus are its conclusions set forth. Having satisfied itself that the imposition of a production tax on anthracite did not constitute discrimination as between that fuel and bituminous coal, the court turned to the question of whether the tax imposed at point of production was in fact a tax on interstate commerce.

It seems to us that here is reiterated and reviewed in unmistakable language a question of more import to the coal industry than the mere matter of whether anthracite is just coal or a special kind thereof. The sum and substance of the court's opinion is that the production of coal is intrastate and not interstate commerce. Representatives of other states were in attendance upon the court, arguing that the action of Pennsylvania in taxing the coal they required was illegal because it would prevent free commerce between the states, as covenanted by the Constitution. To this the court says: "Whether any state or action of a state impinges upon interstate commerce depends upon the statute or action, and not upon what is said about it or the motive that impelled it . . . we can estimate then the contention made. It is that the products of a state that have, or are destined to have, a market in other states are subjects of interstate commerce, though they have not moved from the place of their production or preparation."

This contention is dismissed with the statement that if the "certainty of exportation of a product" from a state should determine it to be in interstate commerce before the commencement of its movement, the result would "be curious. It would nationalize all industries . . . coal yet unmined," because in varying percentages it is destined for consumption in states other than that in which it is to be produced.

The production of coal is intrastate commerce, not interstate, and coal ceases to be governed and protected by domestic law exclusively and begins to be protected and governed by the national law of commercial regulation at the moment it is on railroad cars and commences its final movement to another state.

Looking at the Hands of Accusers

WEST VIRGINIA and non-unionism as practiced in that state were thrown into the ring in a letter from the United Mine Workers to the U. S. Coal Commission last week. Taking Logan County as an example, the letter sets forth that union men, union organizers and union sympathizers are not allowed in that coal field. They are "eliminated" by deputy sheriffs in the pay of the coal companies. The union is simply not tolerated. In fact, the mine workers there and elsewhere in that state are parties to a form of individual contract binding the employee on the one hand and the company on the other from any participation with the union. The statement alleges that union members are "thrown into jail," "brutally mistreated," "killed while thus held prisoners," "arrested and jailed for no reason except that they are union members," etc. It is added that the "Commission itself will realize that something must be done in Logan County and certain other counties in West Virginia if the coal industry is to be stabilized and placed on the level where it should be."

The union spokesmen also contend that this is a condition "provocative of indignation and strife. It should not be allowed to continue. We believe this commission should find out just how the Logan County and West Virginia situation affects the coal-mining industry, for if the commission can find a way to put a stop to the practices that prevail in that field, it will take a long step toward the establishment of industrial peace on a permanent basis."

Then follow quotations from Senator Kenyon's report on that situation, and from President Harding, Woodrow Wilson, Theodore Roosevelt, William Howard Taft, Charles Evans Hughes, John D. Rockefeller, Jr., and others with respect to the inherent right of workers to organize, a right which it is contended is denied in Logan County and other parts of West Virginia. The purpose of this document is not concealed; it is plainly labeled as an invitation to the Coal Commission to investigate the non-union fields and to find some way to force the relinquishment on the part of the operators of their policy of keeping the union out. On a previous date the commission was told by the union that all mines should be unionized—the power of the United Mine Workers extended over the whole country.

Now the existence of non-unionism in one part of

the country is a fact that the commission may properly inquire into. It is entirely proper that the United Mine Workers should call attention to conditions in West Virginia. The opposition of the operators of that state to the union is growing instead of becoming less; there are fewer members of the United Mine Workers there today than a year ago. The union is concerned about this, for the more non-union mines there are the more coal the country can get when the organized districts go on strike. The mine workers have stated their case well. But they have, of course, stated but one side of that case. No one should expect them to put up the arguments for the other side.

Strikes, especially national strikes, and the causes thereof are matters of fact that the Coal Commission is charged to investigate. Measures to establish industrial peace may be looked for among its final recommendations to the President and Congress. It may be that to this end there will be much searching into these bitterly controverted points concerning the methods of certain operators to preserve their freedom from the United Mine Workers. But there also may be questions raised with respect to the methods pursued by the union in keeping intact its territory and in reaching forth for more worlds to conquer. To many it would appear that the anti-union contract of West Virginia is no more iniquitous than the check-off north of the Potomac. Both produce close shops.

No, the union has not stated the whole case to the commission in this document. One has but to change a few words, as Illinois for West Virginia, as union organizers for armed guards, to produce as strong an argument the other way. An impartial investigation may disclose that West Virginia non-union operators are fighting fire with fire, that the closed shop in the North is as fraught with dangers to the industrial peace of the coal industry as that of another kind in the South.

One may be pardoned for looking at the hands of those who protest the methods of the South. The union offers to produce as witnesses numerous persons who "have been victims of the Logan County system who can give direct first-hand evidence." But who will bring in the victims of Herrin?

Function of Storage

IN ALMOST all considerations of the value and purpose of storage of coal at the mines attention is mainly directed to the possibilities, advantages and disadvantages of storage for a period of months rather than to the hour-to-hour and day-to-day stabilization that storage affords. It may be well at the outset to point out that an ability to store about one hundred tons of coal at the tipple is in itself an advantage not to be overlooked.

Suppose that at a mine loading three sizes the supply of empty cars on hand has been cut down by loading to a single car partly full of one size. That single car, if there is no reserve at the tipple, cannot be loaded, for if it is to be filled with slack, then what shall be done with the lump, or if it is to be loaded out with lump, what will become of the resultant slack? The car must be, and quite generally in practice is, held over as a "part load."

As a part load it is counted as one car on the next day's quota. It will be constructively placed the next working day and the mine will lose a car.

It is clear then that the ability to store a small quantity of coal is desirable, but the expense of storage of this kind is by no means inconsiderable. Height rarely is provided at the tipple for the storage of slack and lump or of three sizes unless a conveyor belt is provided. As soon, therefore, as storage is afforded to fill so small a need the question arises, why not seek to obtain other advantages that will make the storage more profitable still? Why not provide for those many occasions where few cars are supplied or where none of them is of the kind that it can be loaded with slack or in other cases with lump, whichever may be needed? Why not arrange to provide against tipple breakdowns, the delay of operations due to dirt, manure or stone in railroad cars, or due to cars needing repairs, the derailment of mine locomotives or mine cars, the delay in running that would result if railroad cars were placed late, left the track or ran out before the day was wholly done? Why not, in short, create storage facilities that would stabilize running and give the tipple crew and all the men on day wage about the plant an efficient day's run?

The additional cost of the coal thus handled is not the real consideration. The loss of storage should not be distributed on the coal thus stored but on all the coal mined. If on the entire output the loss will average but little, it may be safely concluded that the gain from stabilization will far outweigh it.

Suppose, owing to a late arrival of railroad cars, a scheduled run proves abortive; the day force must be paid for two practically wasted hours. In fact after the two hours are concluded the coal standing in cars along the roadway of a drift mine may have to be hauled back to, and into, the mine to keep them free from frost. The distance they must be taken inside may be not inconsiderable if the roadway is the intake and if the ventilation must be kept as strong by night as by day.

For these reasons, or for others which anticipate longer periods of storage, operators are coming to favor the creation of coal storage at mines. In many regions the practice is growing. The intermittent demand for slack, the desire to keep the men from wandering when cars are scarce and rivals for the services of miners are persistent, the anxiety to fill orders when no place can be found for the sizes of coal that the fulfilment of those orders would create, the possibility that railroad cars will be more plentiful later and the assurance that storage will have some effect when the railroad coal quotas are made up, is making operators store coal at the mines. To leave cars unloaded, even single cars, is a sure way to earn a reduced quota from the railroad by which the mine is served.

It should not be overlooked that using a railroad car as a storage bin is a poor way to increase car supply. Producers who more or less regularly tie up one, two or even three cars overnight with part loads are penalizing themselves as well as the railroads. A railroad car costs about $2,500. How much pocket storage on the tipple will that construct? The railroads cannot be blamed if they penalize heavily those who use their cars for such a purpose, even though it be a time-honored custom.

NOMINATIONS OF MEMBERS OF THE UNITED STATES COAL COMMISSION, the fact-finding body authorized by Congress Sept. 22 and appointed by President Harding Oct. 10, were confirmed Dec. 11 by the Senate, giving the commission official status.

At Coverdale Mine Nut and Lump Are Picked on Circular Picking Tables

By A. F. Brosky*
Pittsburgh, Pa

Repicking Table Proposed for Boiler Coal—Bone and Slate Go to Separate Hoppers—Two Sizes of Lump Picked on One Table—Provisions for the Coal and Rock Hoisted in Same Cage

DISTINCTIVE as is the two-car cage shaft of the Pittsburgh Terminal Railroad & Coal Co.'s Coverdale mine, described in *Coal Age* Nov. 30, the tipple is not less so. It does not make many sizes of coal but it is notable for its picking tables and for the flexibility provided in its loading arrangements. Thus on either of two tracks (Nos. 3 and 4) can be loaded lump, combined lump and nut, combined lump and slack and picked run-of-mine. On track No. 1 can be loaded slack and emergency run-of-mine and on track No. 2, nut and combined nut and slack.

The tipple as it is today will handle 350 tons of coal per hour on the assumption that the coal separates in the proportions of 65 per cent lump, 10 per cent nut and 25 per cent slack. In order to maintain this hourly tonnage the coal must be hoisted at the rate of three 2½-ton mine cars per minute. As the cars are carried two at a time in self-dumping cages, it will be seen that the actual speed of hoisting is less than is customary for a single-car cage, the usual practice being to make about two hoists per minute as against 11 which is the speed customary at this mine. The ultimate capacity of the tipple will be 500 tons per hour, which will be attained by the addition of another picking table for lump coal. This will extend out beyond track No. 4. The present plan of the tipple together with the proposed addition is detailed in Fig. 2.

The tipple design is unusual also in that it provides for the future installation of a table to repick refuse from the present lump-coal picking tables, thus furnishing a boiler fuel if desired. In years to come if it be found necessary to store slack coal a belt conveyor will be installed to carry it to a storage bin. The present screening rig is built to accommodate an egg screen with chutes to deliver the screened egg coal to the proposed lump table, which after picking may be diverted to the boom over No. 4 track.

Coal is discharged from the two side-by-side mine cars on each of the self-dumping cages into individual receiving pans that guide it to weigh baskets, each of which has its own scale and recording dial. Each of

NOTE—Headpiece shows Coverdale tipple with its four railroad tracks. The fifth track is used by the refuse-trucking lorry which can be seen under the refuse bin.

Fig. 1
Picking Tables

its four weigh baskets hoist to a 12-ton receiving hopper. A shaking pan feeder delivers coal from the receiving box to the screen. By reversing a plate in the bottom of the feeder, however, run-of-mine coal is fed direct to the emergency loading chute and is discharged into railroad cars on track No. 1.

Lump coal, after passing over the screening area of the screen, is divided into two parts by a diverting arrangement on the upper screen deck. In consequence half the lump coal goes to each of the two circular picking tables. The lump coal thus divided before discharging onto the picking tables passes over a grizzly screen that separates it into two sizes, over and under 3 in. The small size is fed toward the inside edge of the circular table and the large size toward the outside edge. In this way a more uniform coal bed is provided, with consequent increase in the efficiency with which the coal is picked.

The picked lump coal coming from the two tables is delivered to loading booms over No. 3 and No. 4 tracks. The nut coal passing over the lower deck screens is distributed to its picking table, from which it is loaded through a chute into cars on track No. 2. If desired, the nut coal may be delivered to either or both the lump tracks in combination with the lump coal. After being gathered in a steel pan the slack coal may be delivered through a chute to No. 1 or No. 2 track. Delivery to either track is controlled by the two-way chute and a flygate.

For the benefit of those not already familiar with circular picking tables it might be well to give briefly the details of their construction, dealing first with the two lump tables. These are of duplicate construction, each having an inside diameter of 10 ft. and an outside diameter of 20 ft. The table is a circular structural-steel frame covered by removable sections of ¼-in. steel plate. On the under side is a circular track of steel rail, which also fastens to the frame. The inside wall of the table is formed by an angle 6 in. high that revolves with the table frame; but on the outside stationary guard angles form the wall. The table is supported on eight cast-iron pedestals equipped with 12-in. cast-iron supporting wheels designed with but a single flange. The nut table is constructed in a similar manner but is larger, having 18-ft. and 28-ft. diameters.

All three tables are driven by one 50-hp. slip ring motor, the countershafts which drive the two lump tables being actuated by a single cut-steel spur gear. The countershaft of the nut table is driven through a chain transmission, one bevel-gear and a spur-gear reduction. The master wheel of the spur-gear reduction is a segmented rack bolted to the under side of the frame. A jaw clutch on the driving sprocket allows any one table to be operated independently of the others.

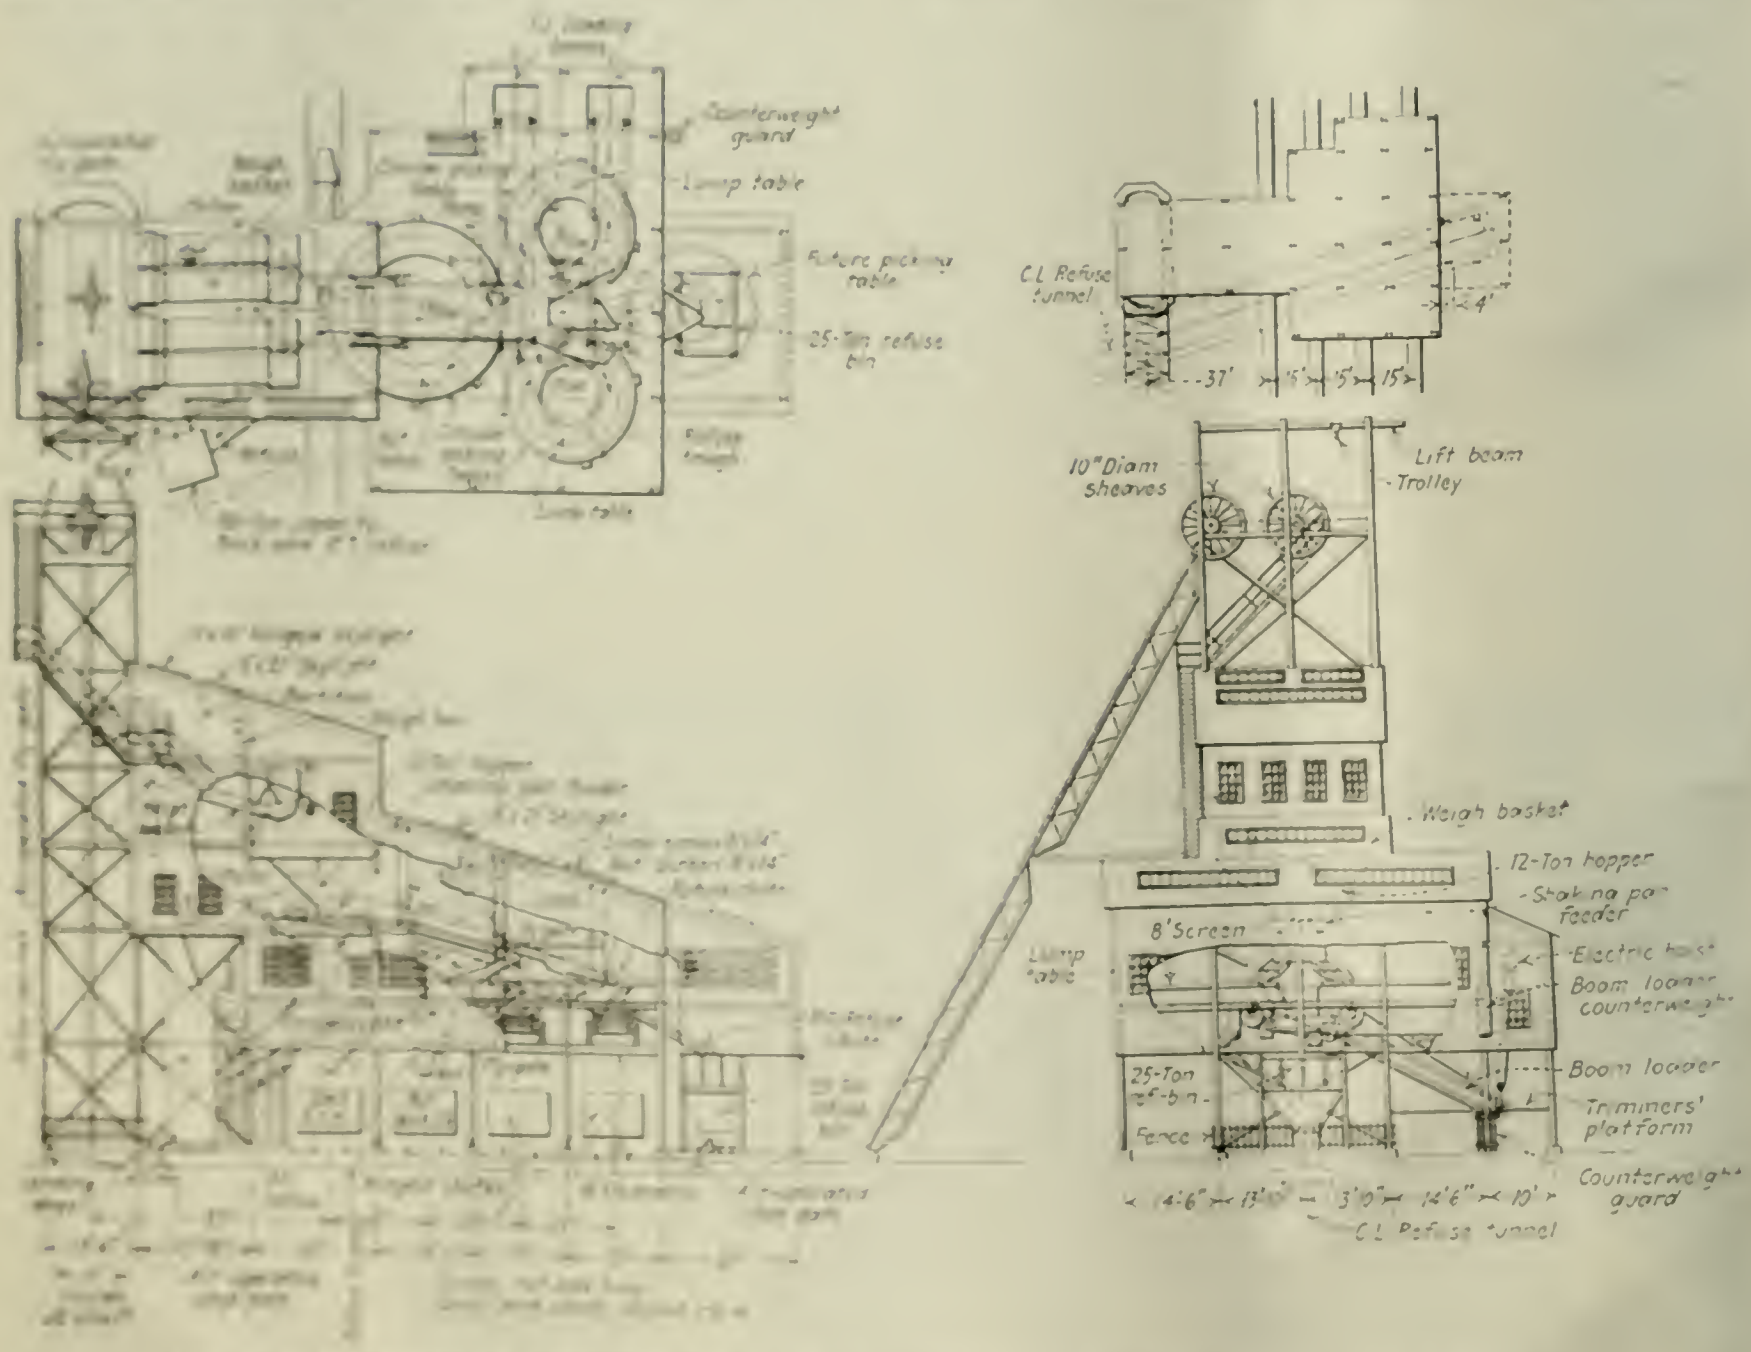

FIG. 3—ELEVATIONS OF COVERDALE TIPPLE OF PITTSBURGH TERMINAL RAILROAD & COAL CO.

...picking table for lump coal will be provided ... drawing. There also is provision ... may be obtained a more passable ... material

A stationary steel plow on each lump table delivers the picked coal through a chute to the loading boom over track No. 4, and a removable plow diverts the coal to a chute leading to the loading boom over track No. 3.

The problem of dumping hoisted rock and bypassing it to the rock bin, while simple enough for the single-car cage, is more difficult of solution where two cars are dumped side by side, perhaps one loaded with rock and the other with coal. For this purpose each receiving pan is provided with a flygate operated through a four-way valve. Either or both flygates on the dumping side may be thrown to let the rock down into a 50-ton bin, where it is removed to the slate pile by means of a refuse-stacking car.

The cager on the shaft bottom signals the dumper or check taker and designates the car or cars containing rock by pressing one or two contact buttons, as the case may be. This operates a remote-control switch, ringing a warning bell and lighting the lamp or lamps by which the slate cars are indicated. The dumper then throws his air-operated flygates accordingly. The cage on dumping throws a trip switch, thus breaking the circuit. A klaxon signal, when sounded from the trimmers' platform, warns the dumper to hold the coal just dumped in the weigh baskets, and the picking-table crew to stop the table and screens. The picking-table crew may likewise warn the dumper to hold the coal.

Refuse picked from a lump table is thrown into one of five small boxings and into a dirt trough. It is then collected by five revolving dirt plows attached to the table frame, which carry the refuse to a conveyor, which in turn transports it to a refuse bin. This bin is wholly separate from the rock bin. The refuse from the nut table is deposited directly on the conveyor which leads to the refuse bin.

In addition to the two weighmen the tipple force consists of eleven men. The man who is stationed at the dumping point to make sure that the cages dump properly also lifts the checks. Each picking table is manned by two pickers, one on the inside and one on the outside of the table. Four car trimmers attend to the coal loading and drop the railroad cars. Rock and refuse from the tipple is conveyed to the dump by a crew of two men.

The tipple was designed and built by the Heyl & Patterson Co., Inc., of Pittsburgh, Pa. The tipple structure is built of steel and concrete and covered with corrugated siding and roofing. Six skylights provide excellent natural lighting for the weigh office and the picking deck. All floors are of concrete.

The picking tables have now been in use for two years and consequently it may be well to set forth the advantages that the officials of the Pittsburgh Terminal Railroad & Coal Co. regard as points in their favor. Foremost among these, it is urged, are the small number of moving parts in their construction; less energy therefore is used in driving them. It is pointed out that the apron picking table has two strands, the upper and the lower. Both are in motion, but only the upper one is available for picking. Thus only half the apron conveyor is serving a directly useful purpose, yet the movement of both parts consumes energy. It is said that the circular table consumes one-third as much power as the straight table.

In every tipple there is much fine dust which has the ability to work its way between moving surfaces, such as the pins, bushings, rollers, links and pans of

FIG. 4.—A CHUTE TO LUMP PICKING TABLE

In the rear can be seen the main screen, at which the nut is removed. In the foreground to the left of the cage chutes by which half the lump coal passes to one of the picking tables. The bar grizzly may be noted, by which the lumps which will make a 2-in. screen are separated and allowed to fall on the upper side of the table.

which the conveyor is built up, parts which when assembled cannot be efficiently lubricated. When such rubbing surfaces are lubricated the lubrication is not retained for any satisfactory length of time.

The circular picking table for lump coal in the Coverdale tipple is 20 ft. in diameter and the inside diameter is 10 ft. This circular table has then a mean diameter of 15 ft. and if straightened out would have a length of πD, or approximately 47 ft. But the segment between the throat of the shaker screen and the discharge point is not effective, so, instead of 47 ft. being the equivalent length of the table it should be figured as only 40 ft. The links, pins, pans, etc. of the straight table when assembled form an endless belt which if cut at one point and straightened out will have a length more than twice that of the table. Allowing, let us say, 5 ft. as the length of those portions that pass over the sprocket wheels, the total length of the belt is about 90 ft.

Further, it is pointed out that in a conveyor 90 ft. long the length of roller chain is 180 ft. and for every 3 ft. of chain are four pans, five pins, four bushings, four rollers and eight links, or in all 1,440 moving parts all subject to friction and to wear. There are 240 pins and bushings that must be lubricated as against eight supporting wheel bearings on the circular table.

The straight table with its many moving and bearing parts must be lubricated frequently, but the circular table not only has fewer bearing parts but needs the application of a lubricant less frequently. The supporting pedestals and wheels of the circular table are lubricated through grease cups that are filled only at intervals. It may be added that the table is absolutely rigid. It is supported by cast-iron pedestals on which are mounted large supporting wheels. In these bronze and not steel bears on steel. As they are placed under the picking table they are protected from particles and small lumps of coal which might work their way between the moving surfaces.

How the Coal Trade Is Organized in Germany*

Trade Parliaments Eliminate Economic Tension Between Employee and Worker—Council of Economics Advises on Legislation Affecting Basic Industries—Distribution of Coal in Charge of Federal Coal Commission

BY F. Z. NEIDEN, M.E.

THE real Germany, like China, rarely is visible to the foreigner. This has never been proved more true than within the last few years. While the eyes of the world and the ears of public opinion were fixed on the external signs of a gigantic struggle in Germany between democratic, pacifist and socialistic tendencies on one side and monarchists, militarists and conservatives on the other, while the disastrous effects of the Versailles Treaty daily became more painfully evident, and while the casual observer saw little but political unrest, economic decay and the glaring contrast between a false luxury and utmost human misery, Germany has been busy in a silent and unobtrusive way thoroughly reorganizing her economic structure along lines entirely new and original. Quite a number of her new organizations have now been working for two or three years under the heaviest economic stress and have stood the test of practicability. They are, therefore, no longer to be regarded as experiments, but worthy of the most earnest attention of all industrial countries of the world—all the more so as the social and economic problems confronting the young German Republic are different only in degree but not in essence from those familiar to all the rest of the civilized world.

Trade Parliament an Interesting Innovation

Among the innovations which Germany called into life on her way to her new ideal of a government of an industrial people, by an industrial people, and for an industrial people, her economic self-administrative bodies, or "trade parliaments," are of the most immediate interest. They represent a new way to alleviate or eliminate economic and social tension between employers and employed, producers and consumers, and form a platform upon which the problems arising in each trade can be settled separately and by men who know the trade, thus immensely simplifying the regulation of the whole industrial machinery of the country and preventing political ignoramuses from meddling with the fine tissues of its productive life.

It will be remembered that in 1920 Germany created a provisional central parliament of industries and trades known as the Federal Council of Economics (Reichswirtschaftsrat). This body is to counsel the Reichstag and the government in all economic matters and especially in all questions of economic legislation. Eventually this Federal Council of Economics is to be based throughout on branch or trade parliaments representing all the various trades separately; but as far only four of these self-contained trade councils have been instituted to represent the most important basic productions, namely that of coal, iron, metals and potash. Of these the Federal Coal Council (Reichskohlenrat) is of most immediate interest to the readers of *Coal Age*.

This council historically developed out of conditions which only 30 years ago were practically identical with those prevailing in the United States today. No trusts or syndicates existed among the operators. The mining association (Bergbauvereine) which had formed in various districts did not in any way interfere with the absolute freedom of the individual colliery as regards production, prices and competition. Some 20,000 to 30,000 coal merchants, dealers and agents, mostly without any organization whatsoever, supplied the channels by which the coal had to make its way from the mine into the bin of the "last consumer."

Owners Form Ruhr Syndicate

Within the last decade of the nineteenth century ruinous competition both from without (England) and within drove the coal owners of the Ruhr to forming the well-known Ruhr Coal Syndicate. Its functions consisted in apportioning a certain percentage of the total Ruhr output—fixed at every new extension of the syndicate agreement—to each individual pit, and in lowering or raising the total output according to the needs of the moment. The Prussian state collieries joined the syndicate on equal terms with the private coal mines, the state collieries being allowed about 10 per cent of the total output of the Ruhr. The syndicate took over and sold through its central sales department all coal mined by its members, including the Prussian state collieries, with the exception of such fuel as certain collieries connected with other industrial enterprises, such as furnaces, iron works, etc., were allowed to put aside for their own consumption in these affiliated works, a maximum percentage of such privileged reservation being stipulated in the syndicate agreement. The Syndicate fixed the prices at general meetings of its members.

This arrangement proving effective and satisfactory, the Syndicate was extended from term to term and other groups of collieries, like those of Lower Silesia, followed the example of the Ruhr collieries. Furthermore, the central sales department of the Syndicate gradually simplified the selling organization by concentrating the most important coal merchants within the various states and provinces of Germany into eleven trading companies, one for each district.

This was the state of development in 1914. The exigencies of the war were at first well met by the organization as it stood, the syndicalized output of the Ruhr mines constituting about two-thirds of the total German coal production. Not until 1917 did the economic stress become so heavy that the then Imperial Government and the Reichstag found it necessary to regulate by imperial authority the distribution of the entire German coal output. For this purpose the office of Coal Commissioner was created, but his powers were and are by no means absolute. As his title of "Federal Commissioner for the Distribution of Coal" indicates, his powers are limited to distribution only, production, transport, and the fixing of prices being beyond

his jurisdiction. His activities, however, served greatly to promote the crystallization of the German coal trade. For the purpose of distribution he established twelve district offices of distribution, one for each of the eleven main coal- and lignite-mining districts and one for the combined production of gas coke. He also formed, for the purposes of control, twenty-five coal-trade bureaus for the various states and provinces. These measures served to accustom the various groups of mines and traders to co-operation, but they also enhanced the desire of the federal and state authorities to retain permanently the control over this basis of all industrial activity which the temporary needs of warfare had thrust into their hands.

Committee of Socialization Named

When, therefore, the revolution of 1918 forced into the forefront the demand for "socialization" of the mines, even those governmental circles which, like the Prussian Mining Administration, were by no means in sympathy with the then socialistic majority, were not opposed to this measure in so far as it involved the complete submission of the coal industry to government control and the absorption by the federal exchequer of its profits. The coal trade itself, however, was strongly opposed to all such attempts and offered a united front against both the socialistic and bureaucratic tendencies. Under the stress of public opinion and the socialistic majority in the federal government the celebrated Committee of Socialization was formed. It consisted of miners' representatives, socialistic theoretical economists and a few practical business men, who, however, did not belong to the coal trade. This committee could neither arrive at a unanimous decision nor did any of its various suggestions appear practicable. Times were too precarious for extreme socialistic experiments. The opponents of "socialization," therefore, won some ground. Yet it was impossible altogether to return absolute power to the owners in the domain of the coal trade as it had existed before the war.

The resultant had to be found in the polygon of these six component forces: Public opinion (coal consumers), theoretical socialists, governmental bureaucracy, and the three diverging interests within the coal trade itself, coal owners, miners and merchants. The National Assembly, by passage of the Coal Trade Act of March 23, 1919, ordered the creation by a "council of experts" of a permanent Federal Coal Council which was to be the instrument through which the community controlled the coal trade of the country. The composition of the "council of experts" closely resembled that of the permanent Coal Council which formed the ultimate result of its deliberations. This result was laid down as an integral part of the Coal Trade Act, received the consent of the National Assembly on Aug. 20, 1919, and immediately went into force.

Considering the structure of the German Coal Trade Act and the organization for which it forms the basis, as well as the various historical influences which were at work at its inception, it must be owned that they were balanced very cleverly indeed. The intention of the Committee of Socialization—namely, to transfer the mining property into the hands of the community in one shape or another—was frustrated. It was acknowledged that individual liberty in enterprise is an asset which cannot be dispensed with in carrying the coal trade, and with it the whole nation, through the dark and bitter years which were to come. The property rights of the coal owners, therefore, remained untouched. However, in order to prevent liberty becoming license, the individual coal owner was firmly placed in an organization that left him enough space in which to move about and enjoy his life, yet kept him from running amuck.

Corresponding to the twelve district offices of distribution as instituted by the Federal Coal Commissioner twelve syndicates were organized. Each syndicate comprises all mines within its territory. The syndicates formed voluntarily. Seven syndicates (the Upper and the Lower Silesian, the Ruhr, the Aix-la-Chapelle, the Saxon, the Lower Saxon, and the suspended Saar Syndicate) are composed of collieries, three (the Rhenish, the East Elbian and the Central German Syndicate) consist of lignite mines, and one syndicate each is composed of the Bavarian low-grade soft-coal mines and the gas works as producers of coke.

These twelve corporations in turn compose the central representative organization of fuel producers, called the National Coal Association (Reichskohlenverband). This association, however, is not autocratic or supreme, but is subordinated to the parliament of the coal trade, the Federal Coal Council (Reichskohlenrat).

All syndicates and the "Association" are limited companies. Under the act each syndicate and the association must elect one miners' representative into its management and two or three miners' representatives and one representative of the employees into its board of directors. The National Coal Association (the "syndicate of syndicates") must, in addition, elect one representative of the consumers into its board of directors. The voting power of each syndicate in the association corresponds to its salable output during the preceding year.

Distribution of Federal Coal Council

The Federal Coal Council is not a company, but a parliament composed of 60 delegates from all parties immediately interested in the coal trade, distributed as follows: 15 representatives of the coal- and lignite-mine owners; 15, miners; 3, employees of the coal and lignite mines; 1, gas works; 1, workmen employed in gas works; 5, wholesale and retail coal merchants; 1, coal merchants' employees; 3, governments of the German states, representing the bulk of the consumers not specially represented (they have by no means a privileged voting power); 2, industries consuming coal; 2, workmen employed in those industries; 2, artisans as consumers of coal; 2, co-operative societies; 1, town consumers; 1, country consumers; 1, railroads; 1, ocean shipping; 1, river and lake shipping; 1 coal mining expert, 1 expert for the scientific exploitation of coal and 1 representative of the boiler-inspection societies.

About one-half of the members of the Federal Coal Council (12 representatives of the coal owners, all of the miners, and the employers and workmen of the coal-consuming industries and the gas works) are indirectly elected by the workers' councils and workmen's committees over the country through the intervention of another parliamentary body called the "Working Community" (Arbeitsgemeinschaft). This institution was created in 1918 for the purpose of constituting a platform on which all social and economic questions and controversies between employer and workmen are collectively settled by an equal number of workmen's and employers' representatives. The "Working Community" as

far has excellently fulfilled its object, and is the given electoral body for the purposes of the Federal Coal Council, as its members have without exception come forth from predatory elections starting in each single shop or mine and then concentrating according to branches of industry on one hand and districts, provinces and states on the other. The members elected to the Federal Coal Council by the "Working Community," therefore, carry the confidence of all employers and men.

The other half of the members of the Federal Coal Council are elected by the big associations for the representation of the interests of the coal merchants, the local dealers, the crafts and trades. The organization of wholesale and retail coal merchants has developed particularly during the last ten years, into a powerful central association with a complete network of branches all over the country.

A few members are not elected, but are appointed by the Federal Secretary of Economics and Production (Reichswirtschaftsminister), among the representatives of the state-owned collieries (the German Federation as such owns no mines nor collieries). The term of membership is three years. One-third of the members are changing each year, but re-election or renomination is admissible. In this way the council is always well stocked with members who are intimately acquainted with its business.

In perusing the list of membership we find the best known names of the German coal trade. Hugo Stinnes, Dr. Silverberg, president of the Rhenish Lignite Syndicate; Dr. Hugenberg, of the Krupp Works; several directors of the Rhenish-Westphalian (Ruhr) Coal Syndicate; Dr. Hilger, the well-known president of the Vereinigte Koenigs und Laurahuette of Upper Silesia; Geheimrat Arnhold of the old firm of Caesar Wollheim, and many other notable "coal barons" are among the coal owners' and merchants' delegates, while the general secretaries and secretaries of all the various miners' unions act as representatives of the men. The Federal Coal Council elected for its president the general manager of the Harpen Colliery, Bergrat Kleine. The vice-presidency was turned over to a representative of the workmen, Herr Imbusch, general secretary of the Christian Miners' Union, which is the least radical among the organizations. Both still hold their office.

A considerable percentage of the members belong to the Reichstag, to the Federal Council of Economics or to the Diets of various German states. This has proven a great advantage in synchronizing the business in the various political and economic parliaments.

The council was fortunate in obtaining at its inception the services of Eugene Kroegeter as general secretary. It is principally due to his great commercial and diplomatic abilities, his knowledge, tact, resourcefulness and broad common sense, that the work of the council was initiated and conducted not on bureaucratic but on sound business principles.

In looking over the above list it will be observed that the fifteen coal owners are in a minority and could be outvoted by the sixteen consumers' representatives if the workmen kept neutral. It must be remembered, however, that it is improbable that the coal miners would remain inactive in questions affecting the development of production and further, that all coal and lignite mines are combined in the National Coal Association and, their representatives therefore, generally constitute a solid vote while it is difficult to get all of the sixteen consumers' representatives "under one hat." Moreover, the coal owners' expert knowledge of all economic and technical questions connected with mining and the sale of coal secures for them a mental weight which often turns the scales of the deliberations of the council in their favor. As regards pure questions of wages, hours or other conditions of employment, these are threshed out within the mining group of the "working community," and the disadvantage in which the composition of the 60 members of the council might here leave the 21 representatives of the employers is, therefore, rarely, if ever, to be feared by them.

Headlight for Mine Service Made Bump-, Dust-, Moisture- and Jolt-Proof

IN the darkness of the mine the best warning to others of the approach of a trip is a powerful headlight on the locomotive. It also enables the motorman to make speed with safety, as it permits him to see obstructions in time to stop and guard against emergencies.

The new headlight manufactured by the Jeffrey Manufacturing Co. is made with a body of great strength shaped so as to cause heavy blows such as may result from falling coal to glance off without doing any injury. The headlight is mounted on a sub-base with a three-point double spring suspension; no small hinges, knobs or thin gratings are used, such as would be readily broken by falling coal.

The parabolic reflector is made of brass, nickel plated and highly polished, to insure a long beam of brilliant light. The metal reflector is used because it is more suitable for mine work than one made of glass.

To have the headlight give satisfactory light continuously it was necessary to make it dust proof and moisture proof. The construction used is that ordinarily required when a headlight is approved by the government, for use in gaseous mines.

The lens, which is a ¾-in. thick plate glass, is held in place in a heavy cast-brass ring by a nut and heavy packing. The ring with its lens is screwed onto the main body of the lamp.

In the top of the lamp body is a hand hole which is closed by a large brass plug. Through this hand hole the focus of the lamps can be adjusted. The cable leading into the lamp is a three-conductor Duracord and passes through a stuffing box which is of the same construction as that used in making permissible motors approved by the United States Government. One of the novel features of this lamp is the use of two standard sockets, one to receive the concentrated filament lamp, which is a 94-watt 110-volt connected two in series with a balancing resistance for 250 or 500 volts. The second socket takes the ordinary lamp used about the mine. The lamps in this socket are used only in case the concentrated filament lamp is not available.

BUMP- AND DUST-PROOF HEADLIGHT FOR MINE SERVICE

Mining a Two-Foot Coal Seam at Forest City

Two- and Three-Road Chambers Are Driven Sixty and One Hundred Feet Wide Respectively—Mining Machines Undercut Coal—Rock from Roadway Used to Pack the Chambers from Which Coal Is Removed

By Dever C. Ashmead*
Kingston, Pa.

FOR many years the anthracite coal field has been known as one in which the beds are thick. From his early study of the geography of Pennsylvania everyone knows that in some places the Mammoth bed reaches a thickness of 100 ft. or more. Comparatively few realize, however, that probably the greater part of the coal comes not from the Mammoth bed but from the thinner beds of the region.

This is due to the fact that over a large portion of the territory all the first mining in the Mammoth bed has been completed. In many places the second mining also has been performed. In places the wasteful methods of mining pursued in the past have prevented large areas of this bed from being recovered.

It is particularly true of the northern anthracite region that the thicker beds have been completely mined out, both stages of the work having been completed. Here the operators have been compelled to turn to thinner and thinner beds as the first mining was completed in those that were thicker.

At many operations it is not advisable or possible to complete the second mining, as buildings have been erected on the surface and coal has to be left for their support. In other places a thick bed of water-bearing glacial drift, such as the Buried Valley of the Wyoming field, makes second mining imprudent or impossible. Some workings also are under the Lackawanna or the Susquehanna River and other seams again cannot be entirely removed without disturbing the overlying thinner beds of coal. This has reduced the quantity of coal in the thicker beds that is available for immediate recovery.

For these and other reasons the attention of the operators has been drawn to the thinner beds, which only a few years ago were considered worthless. Only by accepting the inevitable could they keep their output up to a point consistent with economy. If production falls off only a little the overhead, which remains constant, greatly increases the cost of production. If, however, the production can be maintained by the mining of the thinner beds of coal, then the overhead, being spread over an equal tonnage, will remain constant.

This is a worth-while consideration even though the actual cost of mining these thinner beds is greater than it would be for those that are thicker. If, however, it is necessary to increase the overhead, then no profit would accrue to the coal company from this extra production. In time, however, a point will be reached when the production from the thicker beds will have decreased and the production from the thinner beds increased so that the balanced profit from the two classes of beds will reach a point at which there will be no profit, and the profit that the operation formerly showed will turn into a deficit.

Another factor to be taken into consideration is taxes. Speaking broadly, the coal companies are taxed for any coal that is more than 2 ft. thick, and as long as this coal remains in the ground this tax has to be paid. Consequently taxes on the property ought to decrease as the coal is removed. That, however, seems to be a pretty theory not realized in practice, for the general experience is that no matter how much the coal reserves are depleted, the assessed valuation of the property for taxation purposes nevertheless continually increases.

Throughout the anthracite region the chamber-and-pillar system, with its two mining operations, has been general. The first consists of the driving of gangways and chambers and the second of the reopening of these gangways and the removal of the coal left in the pillars. Often many years elapse between the two operations

LOW-VEIN COAL CUTTER AT WORK OF 18 IN. COAL

A narrow streak of this thickness can be mined when thicker coal of a profitable thickness can be reached. The coal in this bed ordinarily is 28 to 32 in. thick, but here a band was cut down so that the top of the machine is within 2 in. of the roof. This room is 60 ft. wide.

and the expense of reopening, therefore, is heavy and naturally reduces the margin of profit on coal from the second mining. But the thickness of the coal, the protection of the overlying measures and in certain cases the need for surface support has warranted such a dilatory procedure.

In thin-bed mining, however, such a method might be entirely too expensive and good judgment might require that all the coal be recovered in one operation or practically one. This is particularly true when there are no overlying beds to be protected or when the surface does not need support. If the bed of coal to be mined is thin and sufficient filling can be obtained, however, then it may be possible to remove all the coal and gradually drop the surface and overlying beds without disturbing them.

In the Ring Bed at the Forest City collieries the Hillside Coal & Iron Co. is mining this coal by several unusual methods, three of which will be described in this and later issues of Coal Age.

The Ring bed in the Forest City region is known also as the Upper, or First, Dunmore and the Top Red Ash. The coal at this point has an average thickness of 2.35 ft. and in some places is only 24 in. thick. In the particular place where the photograph was taken

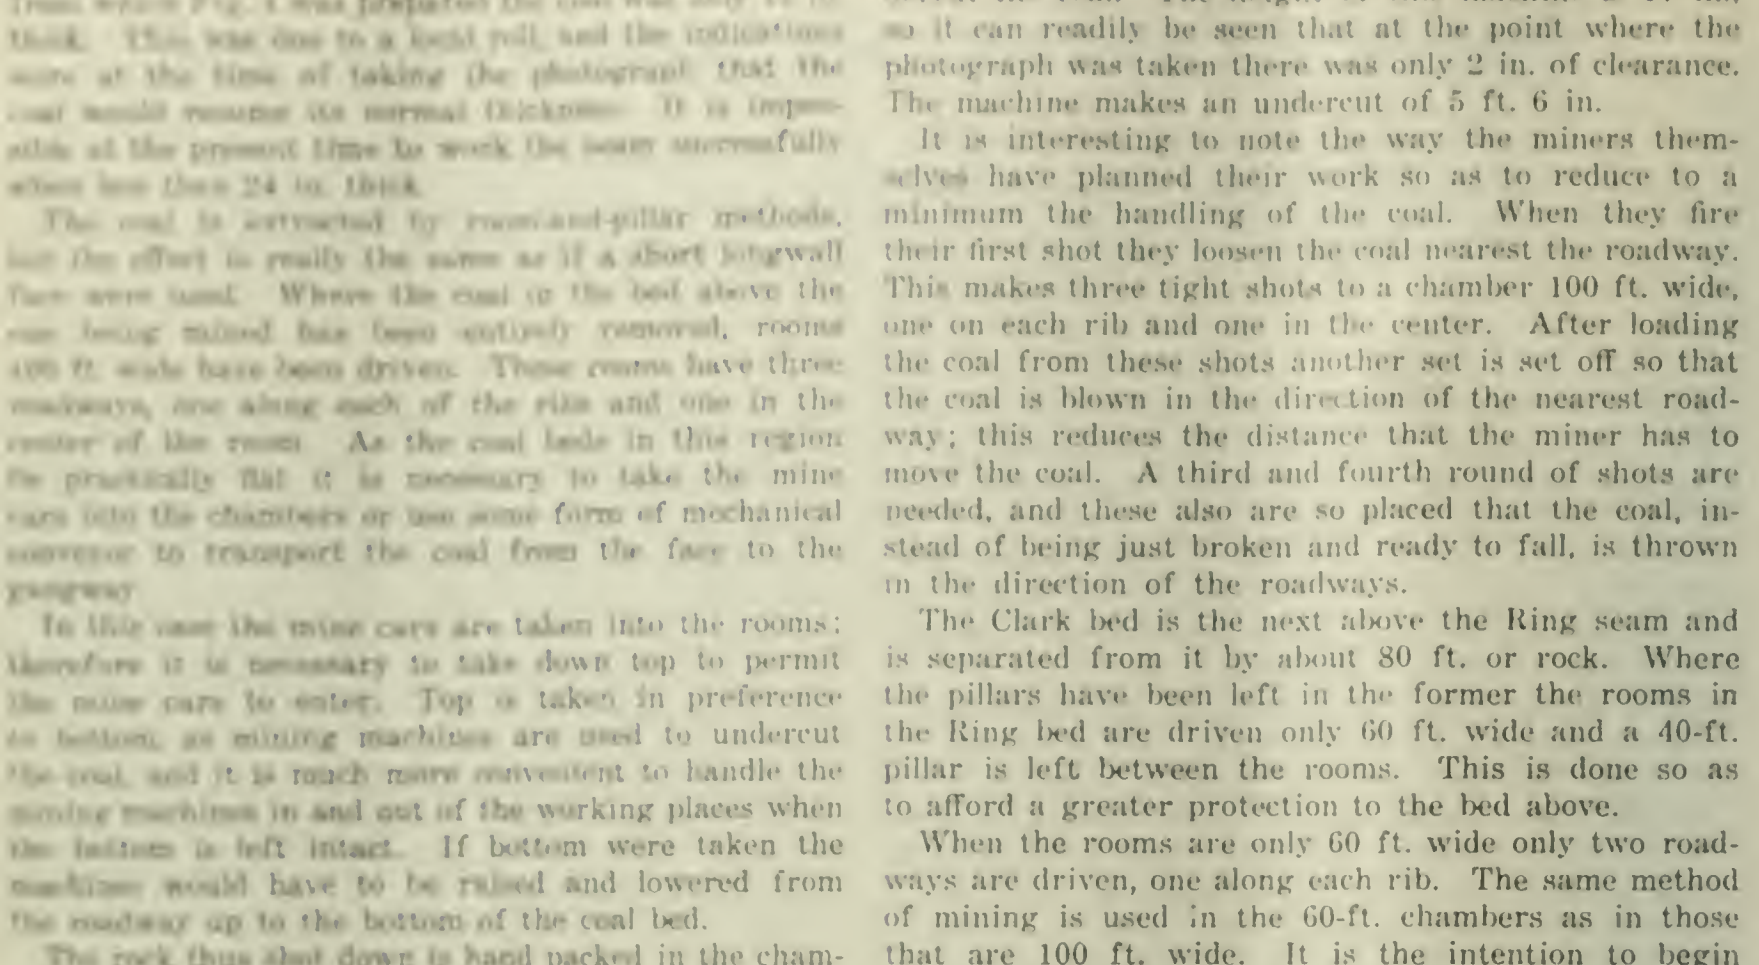
*Anthracite Field Editor, *Coal Age*

From which Fig. 1 was prepared the coal was only 19 in. thick. This was due to a local roll, and the indications were at the time of taking the photograph that the coal would resume its normal thickness. It is impossible at the present time to work the seam successfully when less than 24 in. thick.

The coal is extracted by room-and-pillar methods, but the effect is really the same as if a short longwall face were used. Where the coal or the bed above the one being mined has been entirely removed, rooms 100 ft. wide have been driven. These rooms have three roadways, one along each of the ribs and one in the center of the room. As the coal lods in this region lie practically flat it is necessary to take the mine cars into the chambers or use some form of mechanical conveyor to transport the coal from the face to the gangway.

In this case the mine cars are taken into the rooms; therefore it is necessary to take down top to permit the mine cars to enter. Top is taken in preference to bottom, as mining machines are used to undercut the coal, and it is much more convenient to handle the mining machines in and out of the working places when the bottom is left intact. If bottom were taken the machines would have to be raised and lowered from the roadway up to the bottom of the coal bed.

The rock thus shot down is hand packed in the chambers between the roadways. Sufficient rock is thus obtained to pack solidly the entire space from which the coal has been removed. The roadways are about 10 ft. wide and enough rock is taken down to make a clear height of 5 ft. or more above the top of the rail.



As soon as the roadways have been driven in far enough to insure a full 90-ft. neck they are connected, making a room of the required width. After the rooms are widened out to their maximum width, a Sullivan breasted low-vein undercutting machine is used to undercut the coal. The height of this machine is 17 in., so it can readily be seen that at the point where the photograph was taken there was only 2 in. of clearance. The machine makes an undercut of 5 ft. 6 in.

It is interesting to note the way the miners themselves have planned their work so as to reduce to a minimum the handling of the coal. When they fire their first shot they loosen the coal nearest the roadway. This makes three tight shots to a chamber 100 ft. wide, one on each rib and one in the center. After loading the coal from these shots another set is set off so that the coal is blown in the direction of the nearest roadway; this reduces the distance that the miner has to move the coal. A third and fourth round of shots are needed, and these also are so placed that the coal, instead of being just broken and ready to fall, is thrown in the direction of the roadways.

The Clark bed is the next above the Ring seam and is separated from it by about 80 ft. or rock. Where the pillars have been left in the former the rooms in the Ring bed are driven only 60 ft. wide and a 40-ft. pillar is left between the rooms. This is done so as to afford a greater protection to the bed above.

When the rooms are only 60 ft. wide only two roadways are driven, one along each rib. The same method of mining is used in the 60-ft. chambers as in those that are 100 ft. wide. It is the intention to begin second mining as soon as all the rooms on one gangway have been driven up. It is thought that by that time the rock pack will have taken some of the weight and when the pillars are removed the upper measures will be supported by the rock packing. Of course there will be some settlement, but it will be gradual, and the measures and surface above will be dropped so easily that no appreciable disturbance will be felt in the other beds of coal or on the surface.

Probably one of the most important factors determin-

ARRANGEMENT OF WORK AT NO. 5 SHAFT, HILLSIDE COAL & IRON CO.

ft. 4 in. thick, the top ripped to make a 5-ft. headroom in the roadways serves to pack the full width of the room from floor to roof.

ing whether any new application of a method of mining will be successful is the character of the roof immediately over the coal and also of the overlying measures. It should be stated, therefore, that on the top of this coal is 2 ft. 9 in. of fireclay, then 6 in. of coal. Over this thin seam is 40 ft. of sandstone. The accompanying legend from a borehole shows the character of the measures from the surface down:

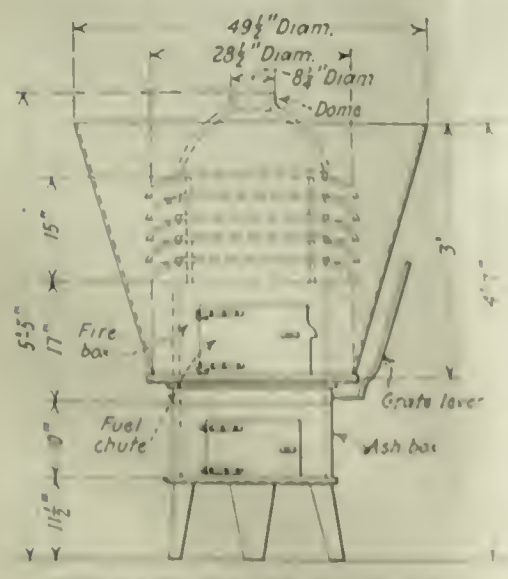
CROSS-SECTION OF MEASURES IN BORE HOLE AT SHAFT

Surface, 10 ft.
Rock, 62 ft.
Grassy Island coal bed, 8 ft. 6 in.
Rock, 43 ft. 9 in.
New County coal bed 2 ft., Not worked.
Rock, 33 ft. 9 in.
Top Clark bed, 8 ft. First mining completed.
Rock, 30 ft.
Bottom Clark bed, 2 ft. First mining being performed.
Rock, 77 ft. 9 in.
First Dunmore bed 2 ft. 9 in. Mining described in article.
Rock, 100 ft.
Second Dunmore bed, 2 ft. 10 in. First mining being performed
Rock, 12 ft.
Third Dunmore bed, 4 ft. 8 in. Mining.

The distance from the surface to the top of the first Dunmore bed is 275.5 ft. Two mining machines are used and they can each cut three 60-ft. chambers in an eight-hour day. It is thought that they will be able to cut three of the 100-ft. chambers as soon as enough of these are started. The cars are transported to the shaft by trolley locomotives.

At present fifty-seven contract miners are employed in mining the coal and from them seventy cars of coal are obtained daily. However, a large portion of the coal comes from development or narrow work. Twelve 60-ft. chambers are being worked and two 100-ft. chambers have been started. Besides this, twelve narrow places or headings and airways are being driven. These do not include the narrow work in driving the roadways for the above mentioned two 100-ft. chambers. So out of fifty-seven men, twenty-four are doing narrow work and these do not include the men driving chamber necks.

An interesting feature in connection with the work is that when the small stringer of coal which lies above the fireclay roof reaches a thickness of 6-in. the miners try to shoot down the rock in such a way as to leave the thin coal undisturbed. After the rock is packed in the chambers they take down this coal and thus often gain a car of coal with a minimum of effort.



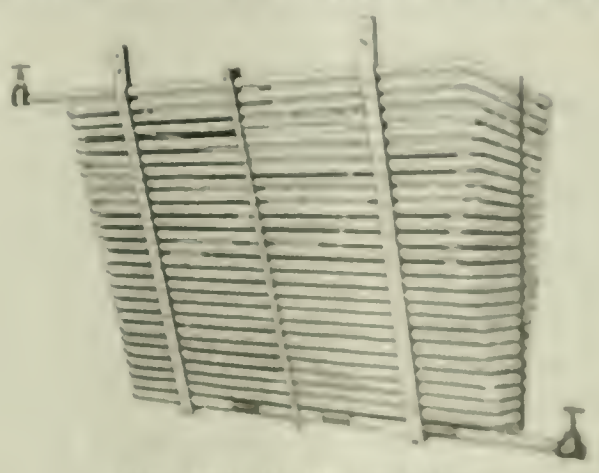
ONE OF THE ROADWAYS IN A 60-FT. CHAMBER

The road packing is shown along the left rib. A small coal stringer is shown above the rock. This is sometimes loaded out. The coal is about 25 in. thick at this point.

Sand Driers for Mine Locomotives

FOR the rapid drying of sand a petticoated furnace drier has been devised which brings almost every part of the sand in close contact with heated metal, reducing the distance through which the heat has to be conducted through the sand itself or convected among its interstices. Sand is a poor conductor of heat, cast iron a good conductor, and the series of "cones" or petticoats around the body of the stove carries the heat into the sand and gives increased capacity to the drier.

It is said that this stove will prepare for service one-half ton of sand in an hour. Smaller quantities, of course, can be dried with lower aggregate consumption of fuel and with less attendance than is needed where maximum output is sought. It is impossible to heat sand satisfactorily when it lies in a body 12 to 18 in. thick as it does in ordinary sand driers. This drier is made by the Roberts & Schaefer Co., Chicago, Ill., as is also the drier now to be described.



FURNACE DRIER WITH PROJECTING CONES

The petticoats or projections from the walls of the stove carry the heat to the sand and keep it in such condition that heat can pass through it

The Beamer steam sand drier is intended for wet sand. It does not work satisfactorily when relatively dry sand is fed to it. It consists of pipes bent to form the walls of a hopper. Through these steam is passed.

The moisture evaporated from the sand is allowed to escape directly into the atmosphere. This is said to prevent the pipes from rusting and the sand from forming into cakes. Where the moisture is held in a receptacle around the pipes they rust badly. This drier has a capacity of about one-third ton every hour.

HEATER MADE OF PIPE

What Can Be Done to Prevent Electrical Mine Fires

Charred Insulation Allows Current to Pass—Leakage vs. Short-Circuits as Sources of Ignition—How Motors May Cause Fires—Dangers from Exploding Oil-Immersed Switches—Need for Metallic Covering for Cable

By a British Correspondent

IT WAS recently stated in a paper by W. V. King, of the West Virginia Department of Mines, that electricity was credited in the United States with causing during 1916 (the last year for which statistics were compiled) 15,031 fires, entailing a loss of $20,780,307, and that destruction of property from this cause was increasing annually. Moreover, coal-mining plants were bearing their share of the burden, few standard electrical installations being found at collieries.

In view of these facts it seems possible that the development of the use of electricity in mines may later be retarded if means are not taken to effect a reduction in the number of such conflagrations. Of the two principal causes of electrical fires—leakage and overloading—the former undoubtedly is responsible for the greater number of these accidents. Of course, when one refers to leakage, the term may be taken to include short-circuits, although electricians generally differentiate between one and the other.

A short-circuit admittedly is a leakage, but it is an exceptionally heavy one, more or less completely localized and of short duration. On high-voltage systems it usually is attended by a report which in some cases might be termed an explosion, for it scatters red-hot metal and burning oil or insulation throughout its immediate vicinity. The redeeming feature of a short-circuit, however, is that it seldom occurs without attracting attention. Steps accordingly may be taken to cope with the fire that the short-circuit may occasion.

Leakage Is Real Danger

The greatest danger from fire is not from the short-circuits themselves but from the leakage that is likely to occur prior to its development into a short-circuit. Leakage cannot be entirely eliminated from any system, however efficient may be its insulation. Moreover, the larger the system, the greater the leakage, as additions to a network of cables increase the number of possible leakage paths and reduce the aggregate resistance offered to leakage. This form of current loss is objectionable only because of its importance economically. Seeing that it is distributed over a large surface, radiation is sufficient to prevent a dangerous heating.

It is obvious that the more localized a leak becomes, the closer it approximates to a short-circuit and to the point where sufficient energy passes to cause the insulation or other inflammable material to ignite, although an actual short-circuit may not develop for some time. It is under these conditions that unexpected fires occur which may attain appreciable proportions before being discovered.

Closely associated with leakage as a problem is the pressure, or voltage, of the leaking equipment. In a mine, or indeed in any kind of installation, it is false principles to install low-pressure equipment with the idea that thereby the dangers from fire will be largely eliminated. Of course, with a low-pressure system the insulation is more easily maintained in a condition that will prevent leakage than with a high-voltage system, but as a rule when low-pressure equipment is installed the insulation often is neglected, partly because the danger from shock is considered unimportant but chiefly because an idea prevails that any condition of insulation not actually permitting a short-circuit is all that is required.

Electrical apparatus employed in coal mines nearly always is exposed to dampness. Conditions vary widely in different parts of the same mine. In some places apparatus may be exposed to dripping water, and in others, such as return airways, it may be subject to the action of a moisture-laden atmosphere, which is peculiarly destructive to insulation and is responsible for much surface leakage. This latter usually leads to serious results. Insulation sometimes becomes charred and thus rendered more conductive, allowing a larger leakage current to pass.

Thus the ill effects are cumulative, and surface leakage caused by dampness is responsible for a large percentage of electrical fires. Furthermore, leakage may be caused by neglect to examine the equipment installed and to repair promptly any defects that may develop. In many mines also, electrical apparatus is subjected to serious overloading. This is especially true of haulage equipment. Damaged roads and derailed cars are the most fruitful causes of difficulties, but, in addition, the number of cars making up trips frequently is in excess of the normal capacity of the equipment. It is often difficult to prevent persons responsible from exceeding the stipulated number.

Adequate Supervision Necessary

The whole matter of eliminating fire risks, given suitably designed apparatus, hinges upon adequate supervision and the maintenance of all equipment in good repair. The purpose of this article, therefore, will be to give a few practical suggestions as to the manner in which electrical apparatus may be kept in such condition as to avoid fire risks. To enable the ground to be covered properly these remarks will be divided under four heads, namely: Electrical machinery, control apparatus, cables, and grounding.

Electrical windings of all kinds require systematic attention if they are to be kept in good condition and free from fire risk. Undoubtedly, the greatest danger occurs when a short-circuit takes place in the windings of a machine that has been neglected. The dirt that usually accumulates in such places will be found to contain a large percentage of fluff, which is highly inflammable. In that event a spark will be sufficient to cause it to ignite. With a high-speed machine, the draft created by the rotation of the armature will quickly start a fire. Moreover, smoldering fluff is so light that it is likely to be scattered onto inflammable material or the dust by which the machine is apt to be surrounded.

Of course, systematic cleaning is the remedy, and this should be effected by means of compressed air wherever it is available. It is questionable whether the usual form of blower sold for this purpose is as effective as it might be. The volume of air is ample, but the pressure is insufficient to dislodge dust and fluff that may be sticking to the windings. However, this may be partly overcome by keeping the surface of the windings as smooth as possible by applying insulating varnish liberally at regular intervals. This, of course, in addition to facilitating cleaning also renders the windings proof against dampness.

Brushes and brush-holders, slip-rings and commutators are fruitful sources of leakage. This is mainly on account of carbon and copper deposits from the brushes collecting current from various parts of the machine. If left without attention, a continuous path will soon be formed along brush spindles and arms, and surface leakage will be set up, often with disastrous effects upon insulation, brushes and sleeves. Motors of the slip-ring type working below ground should always have their slip-rings inclosed in flame-proof enclosures, but thereby heat-radiation from heavily loaded brushes and holders often is impeded. Thus it is not uncommon to find high temperatures existing under such conditions, especially where carbon brushes are employed.

Combination Brushes Give Best Results

Much better results may be obtained by substituting for pure-carbon brushes a combination of graphite and copper. This gives a contact of a high conductivity and at the same time limits the temperature rise in both sliprings and brush holders to a few degrees above that of the surrounding atmosphere. This suggestion, for obvious reasons, does not apply to commutator brushes and holders, but a commutator usually can be kept at a low operating temperature by a judicious selection of brushes.

Many breakdowns both on alternating- and direct-current machines are caused by oil that has leaked from ill-designed bearings. The oily surfaces, whether on brush gear or windings, readily collect dust which eventually clogs air ducts and may form conducting paths over which electrical leakage may occur. In addition to this, dust may cause bad contact on slip-rings and commutators, and expose the latter to short-circuits between bars, with consequent damage to windings.

Oil leakages should be stopped at all costs, and no machine should be accepted from the makers if it suffers from this defect. Oil throwing may be traced to a number of causes. In the case of high-speed machines it is often brought about by excessive axial draft, especially in self-ventilated semi-closed or totally enclosed motors. Worn bearings and too much end play in many instances are the cause of oil throwing. Many remedies suggest themselves, but designs vary so widely that the steps to be taken must always depend on local conditions.

Under the heading of control apparatus falls the ordinary type of open knife switch, with the usual fuses as well as with enclosed, and oil-immersed switches fitted with overload release. It hardly need be pointed out that any form of open-type switch is objectionable in a mine whether gas is or is not likely to exist. There is always the possibility that sparks will be thrown off when a switch is opened under heavy current. Moreover, contact parts of open switches become oxidized and heating often results. This heating is not always confined to the switch but finds its way to terminals, causes oxidation of the various connections and sets up serious overheating, which may result in the ignition of the cable insulation if this consist of inflammable material.

Then there is the possibility that sparks from a blowing fuse will start a fire. This is a real danger when short-circuits occur. To insure safety all open-type switches should be amply protected in order to prevent sparks being thrown onto surrounding material and also to prevent their falling from the coverings which should always be installed to protect operators from shock. Such coverings should be lined with asbestos, and if they are of metal they should be efficiently grounded.

The switch contacts should be frequently cleaned and smeared with just a little vaseline to prevent oxidation. Fuses ought always to be of a type that does not lend itself to replacement by pieces of wire, which in many cases are inserted indiscriminately by unauthorized persons and which afford little or no protection to apparatus in circuit. Furthermore, fuses, where used, should be totally inclosed in a metal case, though ample ventilation should be allowed, for all fuses, if designed to give protection worthy of any consideration, normally work at a fairly high temperature. If too confined the current will cause heating at terminals and contacts and often the melting of solder from cable lugs.

It is unnecessary to open fuse boxes for daily examination. Once the temperature of a box, when working under normal conditions, has been ascertained, any rise in temperature arising from hot contacts or connections immediately will be made apparent by merely placing the hand against the fuse-box cover. Inclosed oil-immersed circuit breakers as a rule are exceptionally safe pieces of apparatus, especially when fitted with proper inlet and outlet terminals. The temperature of switch tanks should be noted frequently by feeling them with the hand. If they are found warmer than is normal, the cause of the increase immediately should be ascertained.

Overheated Switches Are Dangerous

The oil of high-tension switches working in moisture-laden air may become overheated as a result of moisture penetrating the liquid and lowering its insulating properties. In spite of their reliability, overheated oil switches are dangerous because of the possibility that gases may accumulate in the air space above the oil and be ignited. An accident of this kind may cause a serious explosion, throwing hot and possibly burning oil in all directions. However, this may be minimized by the use of suitable safety valves on all switches. Among the precautions necessary to eliminate fire should be mentioned that of seeing that these valves are kept in proper condition as well as providing such valves where the makers of the apparatus have neglected to do so.

In this connection an improvement recently has been made. Instead of providing a safety valve in the cover of a switch or transformer, spring bolts are substituted, allowing the covers, under an internal pressure of a few pounds per square inch, to overcome the spring tension on the bolts and to rise about ¼ in. This will relieve any internal pressure caused by an ignition of gas within the apparatus. It is necessary, of course, that wide flanges be employed in order to provide a satis-

Fires may be caused by inefficient grounding. Where a motor or transformer is left ungrounded and is surrounded by metal floor plates in contact with the frame of the apparatus, not only is there a possibility of the frame becoming live but also the floor. Instances have been known where metal floors, more or less insulated but in contact with motor frames, have been charged to an extent enabling large flashes to occur between them and any grounded metal work such as steam or water pipes.

Should such arcing take place in the vicinity of inflammable material a fire may easily result. Furthermore on systems operating with a grounded neutral one advantage of having all framework also grounded is that circuit breakers and other forms of protective apparatus operate with certainty in case of an insulation breakdown to earth.

In connection with the operation of coal cutters efficient grounding is more important than any other detail of installation because of the possibility of gas ignition by sparking in unexpected quarters. For instance, a coal cutter partly or entirely ungrounded may develop a leak to its frame and current be conveyed along its hauling rope to a compressed-air or water pipe with which it may come in contact. Flashing thus may take place, and an explosion may occur at an appreciable distance from the coal cutter which is really the direct cause of the difficulty. Similarly leakage may find a path to an isolated section of rails at the face, with results similar to those already referred to. It seems highly possible that many colliery explosions have been caused by leakage finding its way to ground at some distance from the actual source.

Conduit Wiring Is Preferable

Finally there is the danger of fire from electric lighting above and below ground. Perhaps nothing electrical about a colliery suffers more abuse than the lighting system, especially if this be composed of old-fashioned open wiring that enables unauthorized persons to meddle with the conductors. It is well known that such systems soon fall into a state of disrepair, the wires eventually leave their insulators and are fastened in all sorts of ways, more often than not in contact with timbers laden with coal dust. This kind of wiring constitutes a danger that should be obvious to anyone in charge of a mine installation and responsible for its safety.

All wiring, whether above or below ground, should be run in conduit unless some form of armored cable is employed together with suitable fittings. Lamps should be provided with guards to prevent their coming in contact with inflammable material. Little danger of this kind exists with the modern metallic-filament lamps, but those with carbon filaments, of which large numbers are still in use, constitute a serious danger.

In one instance of this kind a 32-cp. carbon lamp came in contact with a scaffolding plank at a screen. The wiring had become deranged and the lamp was actually lying on the plank, which was covered with coal dust. When discovered, a hole had been burned through the plank and the wood surrounding the hole was smoldering. Exactly how long it took to burn this hole through a 2½-in. plank was not known, but this occurrence gives a fair indication of the heat generated by carbon lamps and serves as a warning to keep them out of the mine unless they are properly protected.

Coal Mining Institute of America's Biggest Session—I

One Brakeman Killed in Every Hundred and Twenty—New Constitution Adopted—Timber Preservation Makes Red Oak More Durable Than White—Staleness of Air Aids Breathing and Suggests Resuscitation Method

MUCH interest was occasioned at the meeting of the Coal Mining Institute of America held in the Chamber of Commerce Building, Pittsburgh, Pa., Dec. 13, 1922, in the powerful address of the President, Rush N. Hosler, and in his significant statements as to the dangers of mining. He prefaced these remarks with the maxim that "You must know the symptoms before you can diagnose and prescribe for the disease. In Pennsylvania we have gone further in analyzing coal-mining accidents than in any other state or county, as far as is known, with the result that we have been able to point out certain facts relative to accidents which, once known, should prove a stimulant to accident prevention in this state."

He then went on to say that "for every five employees in and around the mines in Pennsylvania one is injured every year severely enough to require medical attention, this injury being anything from a slight wound requiring a surgical dressing to the loss of a life.

"Another fact of special significance is that haulage operatives by actual count made in inspecting nearly 1,500 bituminous mines in Pennsylvania, though constituting only 10 per cent in round numbers of all employees at those mines, had in the six-year period, 1916 to 1921, 26.6 per cent of the accidents."

The author presents tables I and II, in which these accidents are tabulated in much detail. In fact Mr. Hosler gives here many details not available as regard the accidents in any other state and long sought by persons anxious to reduce haulage hazards.

TABLE I—CAUSES OF ORDINARY OUTSIDE FATALITIES ON MINE HAULAGE IN ALL BITUMINOUS MINES IN PENNSYLVANIA, 1916-1921

		Place of Fatality

"These figures are the more striking," said Mr. Hosler, "when it is stated that they show that one employee in every 250 engaged in haulage is killed each year and that annually one boatsman and [illegible] pilot

[illegible] Pennsylvania during the current year. The Coal Mining Institute of America at this [illegible] Pittsburgh, Dec. 13. About seventy-five members [illegible] which constitute the general session [illegible] papers for this half day's [illegible] mine foreman's examination [illegible] Coal Mining Institute [illegible] Pittsburgh [illegible] continued on

in every 120 engaged in that work (however is killed." Mr. Hosler concluded with a strong appeal that the owners of mines exhibit an increased sense of their obligation of affording safety to the men they employ.

Stating that the bank balance was $2,407.82, the expenses $2,005 and the net balance $402.82, excluding $1,000 in Liberty Bonds, the secretary-treasurer, H. D. Mason, Jr., declared that by inducing old members to renew their pledges a debt of $1,253 at the beginning of the year had been wiped out and replaced by a substantial balance.

Sixty-five per cent of the membership, or 1,323 members, were in full standing for 1922. There were 1,603 members at the beginning of the year and 2,033 at the close, that is 430 new members were received during the year. The secretary reported the deaths of E. A. Bailey, J. S. Caslin, E. H. Downey, Charles L. Fay, Samuel T. Oldham, F. S. Peabody, E. C. Northover, G. J. Salmon and J. G. Smythe.

Richard Maier Made Institute President

Richard Maier, mine inspector at Uniontown, was elected president. Nicholas Evans, mine inspector of Johnstown; R. N. Hosler, retiring president of the Institute of Harrisburg and W. E. Fohl, consulting engineer of Pittsburgh, were chosen vice-presidents.

The following additional executive committeemen were elected: A. R. Pollock, Curtisville, Pa.; Frank Hall, Harrisburg, Pa.; M. D. Cooper, Pittsburgh, Pa., and John I. Pratt, Pittsburgh, Pa. H. D. Mason was re-elected secretary-treasurer. The new constitution was adopted by a vote of 135 yeas to 6 nays.

Silas S. Riddle, chief of the bureau of rehabilitation, Department of Labor and Industry of Pennsylvania, read a paper on "The Rehabilitation of Injured Mine Employees" and urged that all coal companies try to find places for men who are injured. He pointed out that sometimes by shifting an injured man from one easy job to another it might be possible to find work for a man who could fit only a place where the work was exceptionally easy. Thus at one mine where the foreman believed that all the jobs for disabled men had been filled, a man with a wooden leg who had been bell ringing at the shaft was made a motor runner, and the bell ringing was handed over to a man who was ever less fitted for active work.

He said that his bureau was not equipped to give assistance wherever needed. In fact it had a total appropriation for all industries of only $50,000 a year and yet there were 140,000 injured annually in the industrial plants of the State of Pennsylvania. The bureau could not offer even to find mechanical limbs for the injured. Not only were there 140,000 injured a year but there were injuries of previous years, to say nothing of those that predated the establishment of the bureau.

W. L. Affolder said that the wish to employ injured men, especially those injured in other works, was halted by the fear that another injury might put the man into the totally incapacitated class and cause the company for whom he then was being employed to pay the large indemnity that goes with total incapacitation instead of the smaller sum that would be paid for the secondary injury if that were the only one sustained. For this reason many companies refuse to employ men who have been injured at the mines of other companies.

Mr. Riddle replied that when a man who has lost one eye is employed by a company and then in their employ loses the other eye he is compensated as if he had been possessed of two eyes and had lost but one. This causes the man to lose full compensation for his disablement, but it is thought better to do this than to bar the man from employment by establishing a principle that would be unfair to the employing company. New York State and Minnesota have special funds to take care of such cases.

In reply to Nicholas Evans he said that the 400 men who were aided by the rehabilitation bureau had expended on them an average of $195. The act did not limit the age of recipients. The requirements of the act forbade the giving of this class of help to aged, helpless, feeble-minded or epileptic persons. Their recourse was to the recognized provisions for assistance. Any man injured at work who can profit by rehabilitation is entitled to help if the bureau is financially able to afford it. The bureau is not a relief organization. Furthermore, it should not undertake to prepare for clerical jobs men whose education has been neglected in youth.

After the noon recess N. S. Greensfelder, of the Hercules Powder Co., showed pictures of strip-pit mining at the William Penn Colliery, of the Susquehanna Collieries Co. The cover at the point shown was about 15 ft. deep, but it was explained that it was deeper further in. It was stated that this was the reason why distant-removal stripping was used as against casting stripping, but one cannot help questioning why, where there is much stripping to be done, casting should not be adopted up to the point where the cover is 40 or 45 ft. deep and distant-removal stripping be used thereafter. Of course if the pit is short and the lightly covered material not wide the large shovel would prove uneconomical, as the cost of setting it up is considerable.

The illustrations showed the lacing in of Cordeau Bickford, the method of attaching side fuse lines to the main lines by simple cutting and wrapping and the exploding of the charges. It was explained that the cordeau has a speed of flame propagation of 17,500 ft. per second and so will explode several holes almost instantaneously. The dynamite is dropped in the holes and tamped with coal dust by a wood dolly. It is said that the cordeau is more rapidly connected than electric wiring, can be safely shipped by express and is economical of explosive.

Not Deep Cut But High Pile Is Troublesome

At the close of Mr. Greensfelder's remarks, S. A. Taylor delivered an address on bituminous strippings, saying that the operation of a casting stripping was limited not so much by the depth of cut as by the height of the dumped ground. A 40-ft. cut will make a 65-ft. fill, and it takes a big shovel to deliver material at such a great height above the ground.

Mr. Taylor remarked that alfalfa was now being planted on stripped areas and showed a picture exhibiting how luxuriant was the growth where this was being done. It was necessary to prepare the surface by the planting of clover. The fact that strippings thus can be utilized will do much to meet objections which farmers have advanced against this method of mining.

The question box was opened by Nicholas Evans in place of W. E. Fohl, who was unable to be present. F. W. Cunningham responded to Question 1, as to the most important point to be considered when entering a mine after an explosion. As might be expected, the query did not submit to any satisfactory answer. Mr. Cunningham said that after the fan had been started,

the party should go in as far as the first crosscut and then, before admitting the air any further, should explore thoroughly the area that the air would have to traverse to see whether any fire could be found therein. Some mines were known to be peculiarly subject to second explosions, but by care to explore all places before ventilating them this fatal defect might be avoided.

Richard Maize, Jr., stated that it was safe to go as far as the air already was circulating at the time the mine was entered, but any further progress must be made with care and as Mr. Cunningham had indicated. To Joseph Knapper the most important matter was to see that all the reliable men were not taken into the mine. He urged that the man who is left with the fan also must be reliable. At the Cherry disaster the man in charge of the fan reversed it and turned the bad air onto the explorers and thus asphyxiated them.

Question 2, as to the methods of stream pollution, was not discussed and question 3 brought some discussion from those who had mined coal and visited coal mines in the anthracite and western bituminous regions but nothing of any detailed character. It was obvious that mining men from the bituminous fields of Pennsylvania were not the most well-equipped men to discuss the mining of coal 30 ft. or more in thickness and on a grade of 30 deg.

N. S. Greensfelder, of Wilmington, Del., was called on to discuss the methods of electric shotfiring and presented the paper he had prepared for the American Institute of Mining and Metallurgical Engineers. J. S. Burton, of Clarksburg, W. Va., said that electrical methods of shotfiring were safer than those with the use of fuse but somewhat more expensive. With electrical caps there was greater certainty that the shot would go off and, moreover, it goes off promptly, saving for shoveling the time spent in waiting for the fuse to ignite the charge.

Avoid Danger of Synchronous Shots

M. D. Cooper related a case where two rooms were being driven up. Both were in about 50 ft. The men lighted shots with fuse at approximately the same time. Both men came out to the entry and awaited the result. A shot went off. Both of the men believed it was his shot and after a brief delay went in to see what had happened. One of the men whose shot had been delayed arrived just in time to receive the force of the blast, and a death resulted.

Mr. Cooper stated that this would not have occurred with electric shotfiring if only one battery had been provided. Mr. Maize added that even if each man had a battery and both fired at the same time, there could be no risk, for the men would disconnect their batteries before examining their places, and an explosion could not occur. Mr. Cooper urged that owing to strikes inexperienced men entered the mines and the safest method of operation was to employ shotfirers. If the law of Pennsylvania relative to that matter were lived up to there would be no accidents.

Mr. Maize said that electric shotfiring was the surest way of eliminating the short fuse and its dangers. The use of any fuse but electric is to be condemned. It was urged that the dry-cell battery be done away with. Mr. Greensfelder said that the battery approved by the U. S. Bureau of Mines cost $18, and Sim Reynolds said that the price was too high if every miner had to be provided with one.

W. C. Hoyt responded to the question as to the best practical method of preserving timber and said that the best of all equipment, the pressure chamber, was too expensive for a single mine. Large timbers could be brushed, and smaller material should be immersed. He showed lantern slides of this class of work.

W. L. Affelder said that when putting in a coke-loading machine he had given half the ties a brush coat of Carbolineum. After seven years, twelve ties were taken out. Six that had not been coated were "rotted to the last possible degree" whereas six which had been treated were in splendid condition. What was more the untreated ties were white oak and the treated ties red oak and hence in themselves less durable.

Treat Timber Where Long Life Is Sought

It was now the accepted practice of the Hillman Coal & Coke Co. to give protective treatment to all railroad ties and to all ties used in the mines except where they are employed in the rooms. All structural material hereafter will be treated with a preservative. It is the intention to brush coat the large and dip the small material.

Dr. Yandell Henderson then described his experiments into the effect of oxygen and carbon dioxide in resuscitation made possible by a grant from the American Gas Association. As a result of this investigation he had designed an inhalator which was equipped to administer oxygen to which 5 per cent of carbon dioxide has been added. Carbon monoxide has three hundred times as much affinity for the hemoglobin of the blood as oxygen, and when breathed in even small quantity will displace the oxygen in the circulatory system. Apparently carbon monoxide has no effect on the nervous system. Its action is secondary through asphyxiation or, as it might be termed, lack of oxygen.

A person supplied with pure oxygen does not show an ability to breathe it if his respiration has been impaired yet a man asphyxiated by carbon monoxide needs to breathe more heavily than another, for he must rid his blood of the poison. It is carbon dioxide and not oxygen, which stimulates breathing. It is only when we are in stale air or have stale air in our lungs that we are disposed to breathe.

In Dr. Henderson's experiments six dogs were asphyxiated with carbon monoxide. Three were given pure oxygen. Two of these were revived and one died. The recovery was slow, however, and uncertain in the case of those that were revived. Three were given oxygen mixed with 5 per cent of carbon dioxide. In two minutes the animals began to breathe rapidly.

After that Drs. Henderson and Haggard experimented on themselves and the two tests they made showed the excellent effects of the combined oxygen and carbon-dioxide treatment. Carbon-monoxide poisoning causes a severe headache, but with this treatment the pain is much reduced. The inhalator is arranged so that 6 or 7 liters of air is provided per minute at the start. As the patient becomes stimulated to deeper breathing the valve is opened till at last 30 liters of air is drawn in.

This is about the limit desirable. It is not well to allow the patient's breathing to be stimulated by too much carbon dioxide, as a valve is arranged to open and give him natural air, which relieves that stimulation and slackens the breathing. Dr. Henderson added that he had gone on the emergency ambulance to attend fifty or sixty cases of asphyxiation by artificial gas. Among these were at least a dozen that were badly gassed, yet all responded rapidly to the treatment.

Problems of Operating Men

Edited by James T. Beard

Humidifying Mines Operated on the Exhaust Principle of Ventilation

Use of Steam Not Confined to Blowing System of Ventilation—Mine Must Be Suitably Planned When Exhaust System Is Employed—Changes Required

REFERRING to the suggestions of James Ashworth, mining engineer, contained in his letter, *Coal Age*, Sept. 28, p. 487, in which he requests further information and data regarding the humidification of a mine, as described in my previous letter, I regret being unable to give the succinct figures he desires. What figures I have are disconnected and seldom bear any relation to each other.

In my study of the subject, what has interested me more has been the practical side of each separate case, rather than the theoretical aspect of the matter. The problem seldom required my rounding the notes taken longer than to complete the task in hand. To publish these rambling notes and figures would interest no one.

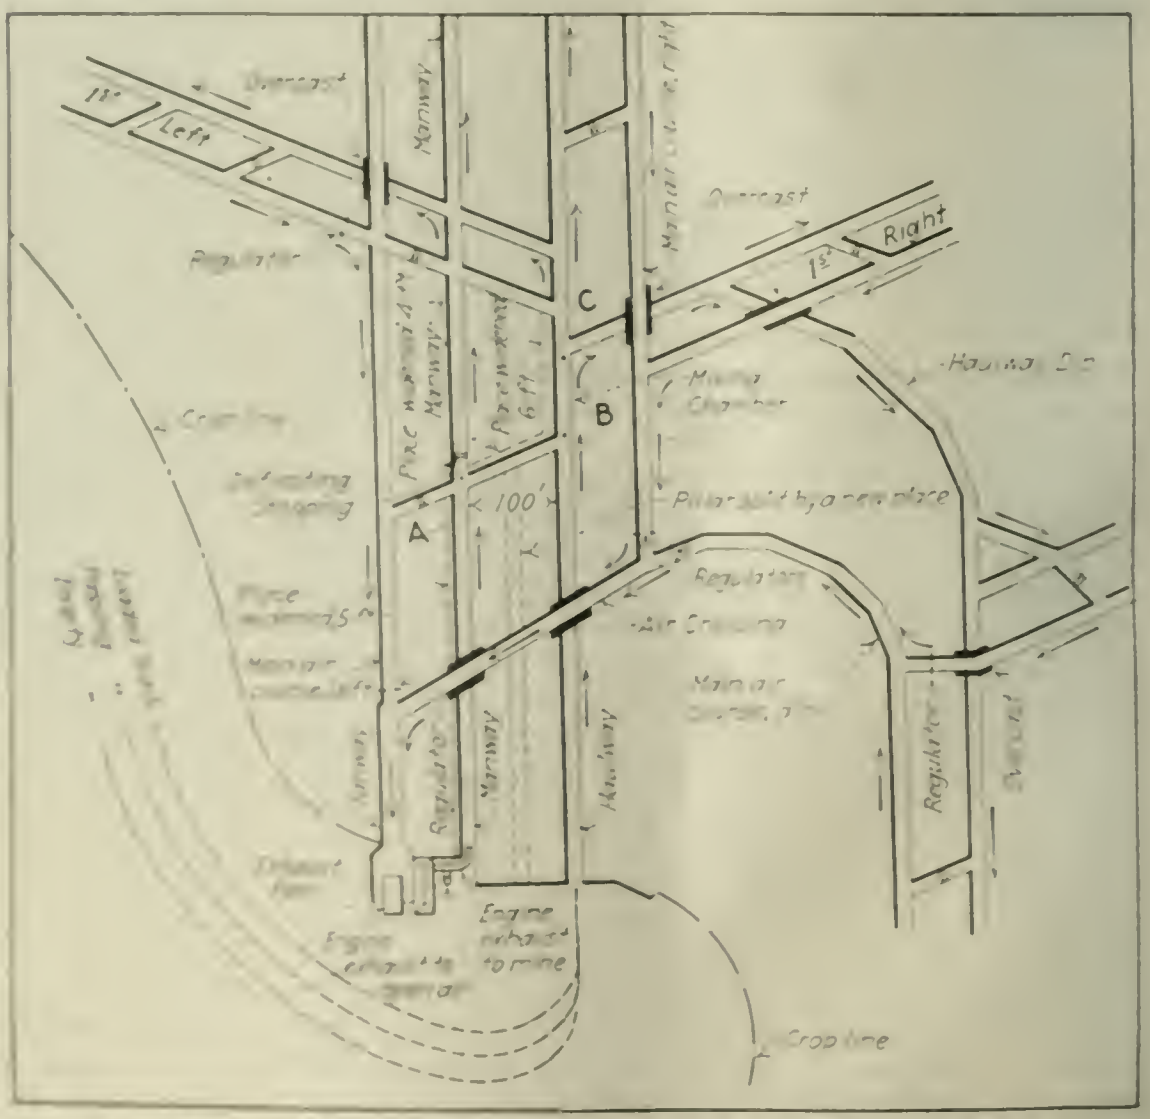
Although it might have been brought out more clearly, it is quite evident that my previous article had reference to the blowing system of ventilation. In one place, I stated that, in all cases where the fan is a blower, exhaust steam turned into the ventilating current will do all that its advocates claim. Also, the illustration given shows the fan installed exclusively as a blower.

Humidifying in Exhaust System

Although the question of humidifying a mine in the exhaust system of ventilation presents greater difficulty than in the blowing system, owing to the use of the intake roads for haulage and as travelingways, it must not be supposed that the use of steam for this purpose is confined to mines ventilated on the blowing system.

Many operators partial to the exhaust system, have arranged their ventilating apparatus so that the air currents can be reversed in the mine. As long as warm weather lasts the fans are run exhausting, but in the colder months, the circulation is changed to the blowing system, in order to permit the use of steam to humidify the intake air.

Even in all cases, it will generally be found possible to introduce the steam into the intake air in such a manner as not to interfere with the haulage of the coal or the use of travelingways by the men. In order to make this clear, I have introduced a plan of an old mine ventilated on the exhaust system, showing the changes that were made to enable the introduction of steam in the intake air, without materially interfering with the haulage requirements.



Present Arrangements in Mine

In this mine, the main headings were driven four abreast. The two center headings were used as a main haulage road and manway, respectively, while the two flank entries served as return air-courses for the two sides of the mine. In order to cut down the ever-mounting cost of ventilating the mine, it was finally decided to utilize the exhaust steam of the engine to moisten the mine air.

It was first thought to make arrangements that would enable the air current to be reversed at times when it was necessary to humidify the air. The estimated cost of making this change was so high, however, that the scheme was abandoned for the time. It was then determined to experiment by introducing the steam into the manway, which was temporarily abandoned as a travelingway.

Changes Made as Result of Experiments in Mine

A stopping was first built in the manway, 5 or 6 ft. inby of the point *A*. The air entering the manway was thus deflected through the crossover to the haulage road, at *B*. By this change, the total volume of air entering the mine was reduced from 119,800 cu.ft. per min., to 114,300 cu.ft. per min. Formerly, 47 per cent of the air traveled the manway, and 53 per cent, the haulage road. After building the stopping at *A*, only 44 per cent of the air entered the manway and 56 per cent traveled the haulage road. Practically, all of the loss thus occurred in the manway, and about the same volume of air entered the haulage road as before.

PROPOSED CHANGES REQUIRED TO HUMIDIFY EXHAUST MINE

The change made it a little breezy on the haulage road, from *B* to *C*, where the total volume of air was passing. However, the men soon learned not to light their lamps until after they had passed this portion of the road. Both the haulage road and the manway were electrically lighted, so that no individual lights were needed there.

Temporary piping was now installed to conduct the exhaust steam of the engine into the manway. When that was done, the men traveled the haulage road as far as to *C*. It had been feared that the moist air coming from the manway would make the haulage road, from *B* to *C*, too wet, hot and foggy, for comfort. There was no fog, however, and one could stay at that point, for an hour, without being wet. Indeed, one could travel the crossover, from *B* to within 15 or 20 ft. of *A*, proceeding against the steam-laden air without feeling discomfort.

Continuing the Experiment

The next step, by way of experiment, had for its object increasing the percentage of air traveling the manway, so as to secure a greater effect in the humidification of the workings. To that end, a wooden brattice was built at the entrance of the haulage road, so as to leave only sufficient room for the cars to pass and about a foot of headroom above the locomotive.

The effect of this obstruction on the haulage road reduced the total air volume entering the mine to 96,700 cu.ft. per min., of which 78 per cent, or 75,400 cu.ft. traveled the manway. It was then found possible to walk to a point 20 or 25 ft. outby from *A* and facing the steam-laden air current entering the manway.

Naturally, these changes increased the water gage at the fan, the increase being from 1.67 to 1.81 in. Contrary to expectation, the increased velocity of the air in the manway did not lengthen the distance required for the complete absorption of the steam by the air current. Instead, this distance was shortened by at least 50 feet.

Moreover, owing to the increased water gage, the work performed by the engine was increased and more steam was discharged into the manway and at a higher temperature. During a whole winter, the mine was operated on this plan with very satisfactory results in respect to the moistening of the dust. The total circulation, however, having been reduced from nearly 120,000 cu.ft. per min. to something less than 97,000 cu.ft. per min., caused a natural scarcity of air in the wet dip workings.

Restoring Loss in Circulation

Finally in order to restore this loss of volume and, at the same time, provide a new manway, so that the men would not be compelled to travel the haulage road, an entry was driven in the pillar, between the haulage road and the old manway, as indicated by the dotted lines in the accompanying figure. Also, as indicated by dotted lines, the old manway, the crossover and a portion of the main haulage road to the first left headings beyond *C* were all widened. These changes had the desired effect of increasing the total air volume to 121,700 cu.ft. per minute.

During the very cold winter of 1917-18, the engine, running at its normal cutoff, failed to supply sufficient steam to warm and moisten the air entering the mine. This difficulty was overcome by lengthening the cutoff to 85 per cent of the stroke, which made it necessary to fire the spare boiler and employ an extra stoker in the daytime. Even then, it was estimated that the cost was far less than by sprinkling.

New York City. F. C. Cornet.

Gas Menace in Mines

Seeking a reliable test for safety lamps —Disadvantage of the carbide test— Few collieries equipped for testing lamps—Bumps and gas.

When reading two recent letters in *Coal Age*, Nov. 9, p. 760, one by a fireboss, relating to the testing of safety lamps with a carbide lamp; and the other by a mine foreman, treating on the subject of bumps in coal mines, I was particularly impressed with the menace of the presence of gas, in the mining of coal.

In all matters pertaining to safe mining, nothing is more useful than the personal experience of men who are in constant daily touch with dangers that must be guarded against if they are to be avoided.

Explosive Mixture Must Surround Lamp as in the Mine

Probably the most important matter pertaining to safety in coal mining has to do with the presence of gas in mines. The seeking of a reliable test, to demonstrate that a safety lamp is in proper condition to be taken into a mine, is a matter that should interest all engaged in that industry.

The carbide test, described by the fireboss just mentioned, is doubtless a severe one if properly applied. However, at a large mine where there are, say a thousand lamps to be tested, it would be practically out of the question to attempt to follow such a plan with each lamp. Too much time would be required for making the test.

In my opinion, moreover, the explosion of the acetylene gas within the lamp would have to be very violent, in order to pass flame under a lamp washer beneath the glass of a Clanny lamp. The violence of the explosion would cause flame to pass through the wire gauze, before revealing the lamp washer under the glass.

What is needed is not such a violent explosion within the lamp, but rather a condition that corresponds more closely to what is attained in the mines where the lamp is liable to be exposed to an atmosphere of gas completely surrounding the lamp.

Desirable as it is to have a reliable test that will demonstrate the [illegible] of a safety lamp, before it is taken into the mine, I regret to say that few collieries are equipped for making such a test in a practical manner. For that purpose, the lamp should be immersed in an explosive mixture contained in a box or small chamber having a glass window to observe the effect of the gas on the lamp.

At one large, up-to-date colliery, I found such a testing chamber that had been arranged but failed to serve the purpose intended, as the lower air ring of a Wolf lamp placed in the box was not exposed to the gas. The gas for testing lamps was taken from the city gas mains.

Gas May Follow Bumps

Before closing allow me to refer to the second feature of the letter mentioned. Speaking of bumps occurring in mines, the mine foreman who wrote the letter makes no reference to the outbursts of gas that may accompany or follow the bumps.

While bumps in mines are dangerous, they are far less so than many outbursts of gas that have occurred. In some instances, the outburst has thrown down tons of coal and filled the mine passageways with gas and suffocating dust.

In addition to the useful information contained in that letter, it would be interesting to learn if the correspondent has ever experienced these serious bumps, in operating a mine worked on the longwall system. It would also be interesting to know if there were any faults in the immediate neighborhood of the mines where the bumps occurred.

In the same connection, let me suggest the practicability of stowing of waste in the worked-out portions of mines, by the hydraulic process, which some may style "flushing." Such a stowing of mine waste might prove an effective means of eliminating both bumps and such outbursts of gas as I have mentioned. M. E.

Alberta, Canada.

Investigation of Mine Explosion Criticised as Incomplete

Vancouver Island explosion killed eighteen men—Investigation by special commissioner—Report criticised as not being thorough—Cause of ignition unproved.

Careful study of the report of the fatal explosion that occurred in No. 4 mine of the Canadian Collieries (Dunsmuir), Ltd., at Cumberland, Vancouver Island, as given in Coal Age, Oct. 26, p. 660, appears to provide ample food for thought. The report was made by former Chief Inspector of Mines George Wilkinson, who was specially commissioned by the minister of mines to investigate and ascertain, if possible, the cause of the explosion and make any recommendations that he might deem advisable. Notwithstanding Mr. Wilkinson's previous acquaintance with the mine, his report as to the cause of the ignition does not appear to be convincing. In one of the concluding paragraphs, as

power wire caused an arc of sufficient intensity and duration to ignite a gaseous mixture, if such was present at the point where the break occurred. Unfortunately, the voltage of the current is not given. It might be assumed that the explosion of the shot disturbed the gas in the cavity of the roof and brought it down to where it was ignited by the supposed arcing of the wires broken when the shot was fired. However, all this must remain as pure assumption, since even the location of the socket where the wires were broken is not given, or its distance from the cavity where the gas was located.

All Contributing Factors Should Be Made Known

In an investigation of this kind, all the factors bearing on the occurrence, especially those on which the conclusions are based, should be clearly stated. In the same connection, it would be interesting to know what indications were found that warrant the conclusion that an arc occurred and that the gas was ignited by that means.

Speaking of monobel, it should be known that this is not wholly a flameless explosive. Is it not true that this explosive, though on the permitted list, has been the cause of previous mine disasters in British Columbia? Instances have been reported where shots of monobel, fired in mines of this province, have produced a windy shot, part of the charge having been thrown from the hole and burned in the open air, in the workings.

In the present instance, has it been established that the shot, fired beneath the cavity in the roof, where gas had accumulated, was not overcharged with the explosive; and, if that was the case, what might be expected to be the result of such an overcharge? What is the evidence that the shot was a good one, as stated in the report; and, on what ground is it stated, "the chances that any flame resulted are remote?"

Finally, the Coal Mines Regulation Act of British Columbia provides for the circulation of sufficient air to make the mine safe for work. In this regard, also, it would be interesting to know how much of the 22,000 cu.ft. of air, mentioned in the report, was passing under the cavity, in No. 4 level, and how far it had traversed the workings before reaching that point.

Inasmuch as gas was known to fill this cavity in the roof, why was not a hurdle brattice erected to clear the cavity of gas, before the shot was fired? I would suggest that the Mines Regulation Act regarding "adequate ventilation" and the permitted list of explosives might well receive careful revision.

Inquiries Of General Interest

Difficult Ventilation Question Asked in Mining Examination

Increase of Volume Due to Addition of Airway—Dispute as to Correct Solution—Tandem Circulation Through Shafts and Airways by Splitting

KINDLY permit me to submit a question said to have been asked at an examination of candidates for mine foremen's certificates of competency in one of the states. My copy of the question reads as follows:

QUESTION—*If an air volume of 10,000 cu.ft. per min. is passing through a mine in a single current, the resistance of the shafts at that time being equal to the resistance of the mine, what extra quantity of air will pass through the mine by adding another airway of the same length and area, the power remaining the same? Suppose each shaft is 6 x 6 ft. in area and 100 ft. deep and that they are connected at the bottom by an entry 6 x 6 ft. in area and 1,000 ft. long.*

This question has started a dispute, in our class, as to its correct solution. It is quite generally supposed that the addition of a second airway means the division of the circulation in the mine into two equal splits. But, even then, the results obtained range from 12,000 to 15,000 cu.ft. per min.

STUDENT.

Joffre, Pa.

The question is an interesting one but too difficult for submission to candidates in examination. The solution would be comparatively simple if it involved only the equal splitting of the air passing through the mine; but that is not the case. The same air volume must pass through the two shafts in a single current.

While there are other methods of solution, probably the simplest is by the potential. In that method, the first step is to calculate the relative mine potential, in each case, and the quantity of air passing, under a constant power, will then be proportional to the potential. In the first case, the total rubbing surface of the two shafts and one airway is $s = 2\ (6 + 6)\ 2{,}000 = 48{,}000$ sq.ft.

and the area $a = 6 \times 6 = 36$ sq.ft. The relative power potential is therefore

$$X_1 = \frac{a}{\sqrt[3]{s}} = \frac{36}{\sqrt[3]{48{,}000}} = 0.9906$$

When a second airway is added of the same size as the first, we assume the air is split at the bottom of the downcast shaft and passes through the mine in two equal splits, before reaching the upcast shaft. This makes a tandem circulation in which the total air volume passes, in turn, through the two shafts, and the two airways. For the two shafts, in series, the area is $a = 36$ sq.ft., and the rubbing surface, $s = 24{,}000$ sq.ft. For the two airways, in parallel, $a = 2 \times 36 = 72$ sq.ft.; and $s = 48{,}000$ sq.ft.

To find the general mine potential in tandem circulations, first find the reciprocal of the cube of each potential division; thus

$$\text{Two shafts, } \frac{1}{X^3} = \frac{s}{d^3} = \frac{24{,}000}{36^3} = 0.5144$$

$$\text{Two splits, } = \frac{48{,}000}{72^3} = 0.1286$$

Then, adding these reciprocal cubes, the reciprocal of the cube root of their sum will be the required general potential of the circulation; thus

$$X_2 = \frac{1}{\sqrt[3]{0.5144 + 0.1286}} = 1.1586$$

Finally, since the quantity of air in circulation, for a constant power, is proportional to the mine potential, and an air volume of 10,000 cu.ft. per min. is circulated against a potential of 0.9906, the volume (x) circulated by the same power against the potential 1.1586 is,

$$0.9906 : 1.1586 : 10{,}000 : x$$
$$= 11{,}696 \textit{ cu.ft. per min.}$$

Examination Questions Answered

Indiana Firebosses' Examination. Indianapolis, 1922

(Selected Questions)

QUESTION—(*a*) *Give a full description of a safety lamp.* (*b*) *What are its essential characteristics?* (*c*) *In What condition and under what circumstances may a safety lamp be unsafe?*

ANSWER—(a) A safety lamp, for general use in coal mining, consists of a brass or steel oil vessel surmounted by a chimney composed of a glass cylinder above which is a cylindrical wire gauze slightly tapered toward the top where it is reinforced by a gauze cap, that being the point most quickly heated and, therefore, more liable to pass flame than any other portion of the gauze. The entire chimney is held in position by upright standards firmly atttached to the oil vessel below and connected above by a brass ring or shield to which the handle of the lamp is attached. The burner is designed to hold a round or a flat wick, as desired. In most lamps, a steel rod is made to pass up through the oil vessel and serves as a pricker for raising or lowering the wick. It is also used to clean the wick of any crust that may be formed in burning. Some lamps, particularly those burning a light volatile oil giving a flame that is readily extinguished, are equipped with an igniter, or spark plug, for relighting the wick when extinguished.

(b) The essential characteristics of a safety lamp are, the isolation of the flame of the lamp from the atmosphere with which it is surrounded. The gauze forming the chimney and that protecting all openings for the admission of air to the lamp, while permitting the free passage of air and gas, prevents the passage of flame by the cooling effect of the wire gauze on the small streamlets of gas-charged air passing through the mesh.

(c) A safety lamp is never safe when handled by an incompetent or ignorant person, or when carelessly handled by another. The lamp is not safe when the gauze has been injured, or is otherwise defective by reason of grease or dirt, particularly dust; or when the gauze has become heated by too long exposure to gas; or when the lamp is improperly assembled or any part omitted.

QUESTION—(*a*) *Describe in full your whole procedure in the inspection of a gaseous mine.* (*b*) *What unsafe conditions would you observe other than the presence of firedamp?*

ANSWER—(a) Before entering the mine, the fireboss must have properly examined, prepared and lighted his lamp, which should then be tested by exposure to an explosive mixture of gas and air. This done, and having observed that the ventilating fan is working properly, the fireboss enters the mine by the intake opening, or proceeds at once to the foot of the downcast shaft in order to observe whether the usual amount of air is passing into the mine. Then, proceeding to the intake end of his section, he examines each place in order and marks the date to show that he has been there. Where gas or other danger is found, it must be removed at once, or all entrances to the placed barred by danger signals.

Having thus examined the working places, roads and travelingways in his section, the fireboss returns to the shaft bottom or mine entrance, and makes out a full report stating what dangers, if any, he has found. The miners' checks for all places where danger was found should then be held by the fireboss, to prevent those men from proceeding into the mine, until their places are made safe and have been examined and found fit for work. The fireboss must then report verbally to the mine foreman, before leaving the mine.

(b) It is the duty of the fireboss to examine for all dangers present in each working place and on all roads and travelingways in his section. He must look for any unsafe condition of the roof or coal, in a miner's place, and observe the need of setting any timbers that may have been dislodged by the firing of shots the night before, or extra timbers that may be required to support loose top. He must also see that what timber is needed is on hand, and note the condition of the place with respect to dust. With most of these conditions, however, a good fireboss becomes thoroughly familiar in making his second round.

QUESTION—*Why is a knowledge of the specific gravity of the common mine gases necessary to a fireboss?*

ANSWER—The specific gravity of a gas is an indication of its relative weight, with respect to air of the same temperature and pressure. This knowledge acquaints the fireboss with the individual tendencies of the several gases to accumulate in the rise or dip workings of the mine, having due regard as to where the gas is being generated and other conditions affecting its location in the mine. For example, methane or marsh gas, being slightly more than one-half as heavy as air of the same temperature and pressure, has a tendency to accumulate at the roof and on steep pitches. On the other hand, carbon dioxide, being more than half again as heavy as air of the same temperature and pressure, has a tendency to accumulate at the floor and in dip workings.

QUESTION—*How would you provide ventilation for a tunnel going off through gaseous coal?*

ANSWER—In case this is a blind heading or tunnel, the air current must be conducted to the face by means of a brattice carried along one rib of the tunnel, the air then returning along the roadway. Instead of building a brattice along the rib, one is often made of an air tube of canvas, say 12 or 10 in. in diameter. Such tubes are made of various lengths. The outlet end of the tube either terminates in the intake airway where the pressure is sufficient to force the required quantity of air through the tube, or that end of the tube is attached to a small blower stationed in the airway or at the entrance of the tunnel. The volume of air supplied at the face of the tunnel must be sufficient to dilute and render harmless the quantity of gas being generated.

Witnesses, Including Miners and Bondsmen, Identify Prisoners in Herrin Trial

By no means all the evidence produced in the first week of the Herrin massacre trial at Marion, Ill., can be said to favor the side of the defense. Lawyers for the United Mine Workers have not yet had a chance to get on their witnesses, but those already heard include union miners and a businessman for a group of the indicted miners, and, under questioning from the state's attorneys, they have identified all five of the prisoners charged with the murder of Howard Hoffman, an employee in the strip mine of the Southern Illinois Coal Co., who was one of 21 men killed June 22 by a mob. The Hoffman case, the first of the series to be tried, involves only five of the long list of men indicted for murder by the grand jury. The five are Otis Clark, Leva Mann, Peter Caringlo, Peter Hiller and Bert Grace.

The day before the trial opened, Frank Farrington, Illinois union president, in a speech at a miners' meeting in the courtroom at Marion declared: "We are going to defend these men and stay with them until they are definitely found guilty. We will not desert them even then unless we are unqualifiedly convinced that they are unworthy of the support of the union. And I think that time will never come."

On the 16th the trial started with Farrington on one side of the room with Attorney Angus Kerr heading the miners' union defense and State Attorney General Brundage on the other side. It was plain from the opening statements of the union lawyers that the issue of unionism was to be kept to the fore and that the defense was going to claim justifiable homicide as the only charge that should be brought against the prisoners, who are being tried for murder. The defense appears based upon the claim that the Southern Illinois Coal Co. not only violated a contract with the union but imported armed ruffians to do it and that the company deliberately invited and caused war in a peaceful community by mistreating peoples by at the Lester strip mine, by shooting union men, and finally by attempting to have the union forces slowly into the open by a fake truce so that the mine guards could shoot many of them.

Capital and Labor Issue Not Involved

The state called it plain murder and State's Attorney Lesle Dorr declared: "There is not a semblance of conflict in this case between capital and labor. I want to try these men under the laws of their country, fairly and honestly."

The state agreed with the defense that the Lester interests had made an agreement merely to recover and not to market the coal and that the company then proceeded to import armed guards and try to market it anyway. But in tracing the history of the case there were wide differences in statements as to just what happened after the mine force had surrendered and was marched along the road to Herrin, with desperate shooting on various brutal forms along the way. The defense sought to prove that the five men charged with the murder of Hoffman were not at the scene of slaughter at all but were from one to five or six miles away. The killers were strangers, it was asserted.

Dr. A. T. Black, head of the Herrin hospital, was the first witness, testifying to the nature of Hoffman's wounds. Coroner "Bill" McCann, one of the outstanding figures in the aftermath of the massacre, got considerably mixed up when he testified that Hoffman had died of gunshot wounds, but he could not describe the wounds. Charles F. Hoffman, white-haired father of the dead man, identified a photograph of his son. Those followed some identifying of prisoners. Lawrence Beers, a Herrin truckman, identified Peter Caringlo as one of the armed men he had seen leading the prisoners through Herrin the morning of June 22. E. F. Poole, real estate dealer, identified Leva Mann and Perry Hiller as not a defendant in the Hoffman murder. A. M. Tells, another realtor, identified Robert Walker. Then all told of scenes of horror they had witnessed in coal around the Herrin cemetery where a group of the prisoners were dragged, mutilated and killed.

George H. Harrison, farmer and banker, and one of the seventy-five Herrin men who gave bond for the indicted union men, and his son Fred Harrison were witnesses the second day of the trial. They told of the killing of several men near their farm, naming Bert Grace and Dallas McCree as killers they could positively identify. Donald Ewing, a Chicago newspaperman, testified vividly and with accuracy of detail many of the scenes he had witnessed, especially of the incident in which Bert Grace, with a revolver, prevented Ewing from giving water to the dying Hoffman. William Goodman, miner and farmer, identified Otis Clark as being one of the armed mob which marched prisoners past his house. Henry Graves, miner and farmer, also testified that he recognized the prisoners in the mob.

Thus all five of the prisoners indicted for the murder of Hoffman were identified in the testimony already given.

Smokeless Operators Meet and Name Officers

That millions of tons of smokeless coal are available at the mines in the smokeless coal districts of West Virginia waiting for the necessary railroad equipment to be shipped to northern points where the coal shortage is acute, was a statement made by T. A. Farrell, chairman of the Transportation Committee, at a meeting of the Smokeless Operators' Association of West Virginia held Dec. 14 at the Waldorf-Astoria, New York City.

In the knowledge that considerable suffering has resulted through lack of fuel in New York, Mr. Farrell has taken the matter up with the Interstate Commerce Commission and has been assured of adequate transportation facilities for the near future. George Wolfe, of Berkley, W. Va., acting secretary of the association, pointed out that the smokeless coal district contributed 4,000,000 tons of coal every month during the strike, and when the strike was brought to an end, the railroad lines leading from the coal districts were almost paralyzed by the large increase of production. Since the end of the strike, he said, smokeless operators were able to ship only half of their normal production to parts of the country where it was needed most.

The blame for the inadequate transportation facilities was placed on legislation during the past few years, which makes it extremely difficult for the railroads to finance such development of their lines as is necessary to meet exigencies like the present coal shortage. Smokeless coal is suitable for both household and commercial purposes, Mr. Wolfe stated. He said that, given the necessary railroad equipment, the smokeless fields alone could bring considerable relief in the present crisis.

At a luncheon held after the business meeting in the morning the election of the following new officers was announced: President, R. H. Gross of Boston, president of the New River Coal Co.; First Vice-President, O. M. Doyerle of Bluefield, W. Va., president of the Flat Top Pocahontas Sales Agency; Second Vice-President, Kooper Hood, of Cincinnati, general sales manager of the Houston Coal Co.; Treasurer, George R. Collins, of the Smokeless Fuel Co., Charleston, W. Va.

Illinois Operators Join Assigned-Car Fight

Illinois operators have joined with the National Coal Association in the support of its effort to effect the abolition of assigned cars. The railroads presented their rebuttal last week, and an effort was made to establish that the claims of the operators that an adequate and regular supply of railroad fuel could be obtained without assigned cars were unsound. Testimony was presented by representatives of the Public Service Corporation of New Jersey and by the Cambria Steel Co. to the effect that a preferential car supply is necessary.

The Interstate Commerce Commission has decided to handle the assigned-car matter separately from the other features of mine rating and car distribution. Separate dates will be assigned for the oral argument of these divisions of the case. Since it is believed that many of the differences of opinion with regard to rules can be threshed out by mutual agreement, a joint conference of representatives of industry and of the carriers probably will be held in the near future.

Commerce Commission Decides Against Joint Mines, Limiting Car Supply to 100 Per Cent

In dismissing complaints of irregularity in car distribution in the case of the Bell & Zoller Coal Co. et al. vs. the Baltimore & Ohio Southwestern Railroad Co. et al. the Interstate Commerce Commission on Dec. 11 delivered a decision of far-reaching importance. As similar issues were involved, the commission's report also embraced the following cases: Fairmont & Cleveland Coal Co. vs. Baltimore & Ohio R.R. Co., 62 I.C.C. 269; No. 12399, Vigo Mining Co. et al. vs. Pittsburgh, Cincinnati & St. Louis R.R. Co. et al.; No. 12081, Fairmont & Cleveland Coal Co. vs. Baltimore & Ohio R.R. Co.; No. 12082, Fairmont & Cleveland Coal Co. vs. Monongahela R.R. Co.; No. 12083, New River Co. et al. vs. Virginian Ry. Co., and No. 12084, New River Co. et al. vs. Chesapeake & Ohio Ry. Co. upon reargument.

The Fairmont & Cleveland Coal Co. vs. B. & O. R.R. Co., 62 I.C.C., 269, termed the Fairmont Cases, related to rule 4 of Car Service Circular CS-31, Revised, which was found to be unreasonable and unduly prejudicial to joint mines and unduly preferential of local mines, to the extent that it limited the aggregate orders for cars of the joint mine to 100 per cent of its gross daily rating. It was also found that for the future, during periods of car shortage, defendants should distribute cars to the joint mines on their lines on the basis outlined in In Re Irregularities in Mine Ratings, 25 I.C.C., 286, called the Illinois Case. In effect, that rule provided that on days when the joint mine orders cars from only one carrier it shall be furnished cars based on its full rating from that carrier, and on days on which it orders cars from both carriers its rating on each of such carriers for the purpose of ordering cars should be 75 per cent of its full rating, subject to the limitation that on no day shall it be furnished with cars in excess of its maximum rating. No order was entered. Upon petition of intervening local mine operators, those cases were reopened for further argument and consolidated with Nos. 12362 and 12399. These cases were submitted together.

The complainants operate joint mines in West Virginia, Illinois and Indiana, as well as local mines in Illinois, served by two or more carriers. All the complaints substantially allege that defendants' rules, regulations, and practices governing the distribution of coal cars to complainants' mines served jointly by two or more railroads have resulted in the distribution, during car shortage periods since October, 1918, of a smaller share of empty coal cars to complainants' mines than is distributed to and received by mines in the same territory which are served by one defendant carrier only; and have been and are unreasonable, unduly preferential of complainants' competitors, and unduly prejudicial to complainants, in violation of sections 1 and 3 of the interstate commerce act. The commission is asked to prescribe just, reasonable, and nondiscriminatory rules, regulations, and practices to govern the distribution of coal cars to mines served by more than one carrier.

Various operators and committees intervened in opposition to the complaints in Nos. 12362 and 12399. The Union Colliery Co. was the only intervener in whose behalf evidence was offered. Various intervening petitions were filed in Nos. 12081, 12082, 12083, and 12084. The defendants assume a neutral position and are merely concerned with the establishment of a rule that will be fair and reasonable to all parties concerned, and which will be workable.

"The complaints herein are directed against the last sentence of rule 4 of Circular CS 31, Revised," says the commission's report, "which limits the joint mine orders for cars from all the carriers to the gross daily rating of the mine. The whole subject of the ratings of coal mines, other than anthracite, and the distribution of cars between them in times of short car supply, is pending before us in another proceeding. While there may be local variations in method of application, the general basis of ratings may be stated in substance.

"The rating of a local mine is determined by taking the total tonnage shipped by the mine during the preceding month over the carrier serving the mine, dividing it by the number of hours worked in producing it, and multiplying the quotient by the number of hours in the recognized work-day (not more than 10 hours) of the individual mine. A rating so determined is called the daily rating, as distinguished from the gross daily rating which applies to a joint mine, and which is determined in a similar manner, but by taking the total tonnage shipped over the lines of all the carriers serving the mine.

"Complainants urge that under rule 4, here attacked, the natural advantages of the joint mine are not recognized in the distribution of cars. They say that the rule does not give the joint mine any advantage in this respect which due to the development of its markets and the contracts which it has assumed, it must, of necessity, skip over cars other than the one having the greater car supply. Under the present rules a joint mine can receive as great a number of cars as the local mine located on the line having the greater car supply by confining its orders exclusively to that line. Complainants contend that rule 4 has had the effect, therefore, of limiting their distribution to markets on one railroad only.

Commission Not in Agreement with Complainants

"With this contention we are unable fully to agree. Whenever the joint mine orders cars from the different carriers serving it, it is doubtless due to other compensating advantages, which outweigh those of a temporary greater car supply, and such election is the supreme choice of the shipper. . . .

"Interveners contend that unless an order for cars for the transportation of coal is accompanied by a bona fide tender or setting aside of the coal to be transported it is not a reasonable request for transportation within the meaning of paragraph (4) of section 1 of the interstate commerce act.

"Interveners further contend that the first sentence of paragraph (12) of section 1 requires every carrier, during periods of car surplus, to make a just and reasonable distribution of cars among the mines served by it as customarily dependent upon it for car supply and leaves the question of what is a just and reasonable distribution of cars to the discretion of the carrier or to an open complaint and after full hearing, while the second sentence of paragraph (12) specifies the particular manner in which the cars are to be distributed during periods of car shortage and leaves nothing regarding the distribution to the discretion of either the carrier or to us. This sentence does not use the term 'distribution,' but interveners argue that to maintain and apply just and reasonable ratings and to count each and every car furnished to or used by any coal mine for transportation of coal against the mine is a mandatory rule of law requiring an equal per cent distribution of cars in accordance with the prescribed ratings, whether the mine be served by one or more carriers.

"In view of our conclusions herein and because the interpretation of paragraph (12) is before us in another proceeding now pending, we will not pass upon that contention here.

"The present facts considered, we do not conclude upon these records that the rule attacked, Rule 4 of Circular CS-31, Revised, is in principle unreasonable or unduly prejudicial. Our former conclusions in the Fairmont Cases, based upon a mistaken adherence to and extension of the decision in the Illinois Case, are reversed. The present decision is of course without prejudice to such determination of the questions before us in the general proceeding indicated as involving the ultimate rating and car-distribution rules as the record may there permit. The complaints herein will be dismissed, and we will enter an order to that effect."

Suggests That Government Buy Cars and Rent or Lend Them to the Railroads

Purchase of cars by the federal government, to be loaned or rented to railroads requiring additional rolling stock in emergency, is the suggestion made by F. B. Nigh, secretary of the Michigan-Ohio-Indiana Coal Association, as a solution of the difficulties in which the coal industry and its indispensable adjunct, the railroads, find themselves. Mr. Nigh's proposal was made in the form of a reply to a letter of inquiry from John Hays Hammond, chairman of the U. S. Coal Commission.

The letter is of unusual interest in that it attempts to provide an answer to an economic problem in a way that will not only increase production of coal and lubricate and relieve the transportation system but will redound to the benefit of the coal-consuming public and ease the burden of high prices and mental anxiety now resting upon it.

"All that is required to guarantee to the entire coal-consuming public its fuel in sufficient quantities and at reasonable prices at all times is uninterrupted production and an adequate car supply, and with this guarantee we have every reason to believe that the economic principle of supply and demand will guarantee to the public coal at a satisfactory price. Time and time again it has been proved that the law of supply and demand is an effectual answer to price-fixing proposals," says Mr. Nigh.

Commerce Commission Rules Against Roads On Coal Rates to Hagerstown District

The Interstate Commerce Commission has decided for the Hagerstown Chamber of Commerce in Case No. 12726. This involved rates charged by the Western Maryland Railroad Co., the B. & O., the Great Haven & Bruceton R.R. Co., and others on applicable rates on bituminous coal from the Cumberland-Piedmont, Meyersdale, West Virginia and Pittsburgh-Youghiogheny coal districts to Hagerstown, the Commerce body charging them to be unreasonable and unduly prejudicial to its members and unduly preferential to consumers at Martinsburg, W. Va., and Harrisburg, Pa.

The railroads argued that a reduction in the rates to Hagerstown would seriously affect rates to destinations beyond that city and Harrisburg, particularly with respect to the Pennsylvania if that carrier decides to meet the reduced rates at Hagerstown. The I. C. C. found the rates unreasonable to the extent that over the B. & O. and Western Maryland via Cherry Run, W. Va., and over the Western Maryland direct they exceed or may exceed the rates contemporaneously maintained over those lines from the points of origin considered to Martinsburg and Harrisburg.

That rates charged on coal from Melcroft on the Indian Creek Valley R.R. to Baltimore, Philadelphia and other Eastern destinations on the B. & O. are unduly prejudicial to the extent that they exceed the rates on coal to the same destinations from mines served by the B. & O. in the Meyersdale region, is the conclusion of a tentative decision made by the Interstate Commerce Commission examiner who investigated the case brought by the Melcroft Coal Co.

Class 1 Railroads Consume 7,833,000 Tons Of Coal in September

Class 1 railroads consumed 7,833,000 net tons of coal during September, 1922, as charged to account 394, compared with 7,293,000 tons in September last year, according to a report of the Bureau of Statistics of the Interstate Commerce Commission covering 170 steam roads. For the first nine months of 1922 these roads consumed 66,750,000 tons as compared with 57,195,000 tons during the same period in 1921.

The delivered cost per ton in September was $4.85, or $1.04 above that for September, 1921. The per-ton cost for the year to September 30, however, was only $4.94, as compared with $4.85 during the corresponding period of 1921.

Fuel oil consumption continues to gain. During September 138,054,000 gallons was used, as compared with 116,059,000 gallons in September, 1921. The figures for the first nine months of 1922 and of 1921 were 1,097,282,000 and 1,042,939,000 gallons respectively.

Presents Amendment to Coal-Commission Act in Senate; Early Enactment Expected

Crowded committee and legislative calendars have delayed the expected early consideration by Congress of the bill to amend the act creating the U. S. Coal Commission, but as no signs of marked opposition have appeared it is expected that this measure will be enacted into law soon.

The bill introduced in the House by Representative Winslow previously was presented in the Senate last week by Senator Borah in identical terms, and was referred to the Committee on Education and Labor, of which its sponsor is chairman. There is no indication of material opposition in this committee or in the House Committee on Interstate Commerce, to which the Winslow bill was referred. The prospects are that any opposition which may appear on the floor will be outvoted easily.

The principal point in the bill is to authorize the fact-finding commission to gather information by sworn questionnaires, with penalties for failure to answer and for false statements.

Lehigh Valley and Glen Alden Companies Will Settle for Mine-Cave Damages

Officials of the Lehigh Valley and Glen Alden coal companies, two of the largest in the anthracite fie'd, have made known their willingness to recompense owners for property damaged by mine caves, the announcement coming after the U. S. Supreme Court declared unconstitutional the Kohler mine-cave law, which forbade mining in any district where surface property and human lives might be endangered.

Advocates of surface protection will offer a new measure to the next Pennsylvania Legislature demanding 100 per cent restitution for all damage brought by caves.

Indiana Operators Surrender; Avoid Strike

The operators of Indiana did not relish the idea of a strike in that state just now with the markets of the West at last calling for coal. Anyway they concluded that they were standing on a technicality when they said Dec. 4 that they were going to refuse at the mid-month pay to check off an additional union assessment for the national organization of the United Mine Workers. In session Dec. 13, four days before the deadline set by John Hessler, president of District 11, they concluded the legal basis for their refusal on contract ground was hazy. So they surrendered. The check-off of $4 for the national union organization is new being made in Indiana.

Coal Consumption by Utilities Made Big Gain in October

Electric public-utility plants consumed 3,247,020 net tons of coal during October, according to a recent report of the Geological Survey. This compares with 2,899,074 tons in September.

The average daily production of electricity by public-utility power plants in October, as was predicted last month, broke all records of output, making the fourth time that a record has been established since May. The daily production of electricity in October was 139,100,000 kw.-hr.—a little more than 3 per cent greater than the September record. The total output for the period January to October, inclusive, was 38,653,000,000 kw.-hr., an increase of more than 15 per cent over the same period for 1921.

The use of fuel oil and gas in the production of electricity by public-utility power plants evidently reached a maximum in September, as the daily consumption of these two fuels in October decreased from the September figures.

Charging Oppression, Miners' Union Asks Federal Coal Commission to Probe Conditions in Logan County

The United Mine Workers on Dec. 13, 1922, called the attention of the U. S. Coal Commission to conditions that exist in certain sections of the coal-mining fields of West Virginia and suggested "that the commission make a full investigation to ascertain the facts and to estimate the effect of these conditions upon the coal-mining industry in general. The commission will find in these conditions some of the very influential causes of the demoralization of the industry. While similar conditions exist in other parts of the State of West Virginia, we desire to call special attention to Logan County because it is typical of others and a glaring example of the manner in which brutality and oppression against union coal miners is practiced by coal operators and coal companies.

"Logan is the second largest coal-producing county in West Virginia.

"Union miners, members of the United Mine Workers of America, are denied by these coal companies the rights that belong to every American citizen. If a miner joins the union he is at once made the victim of discrimination in employment. The right to organize does not exist in non-union Logan County.

"Miners who join the union are driven from the county.

"A miner loses his job if he talks in favor of the union.

"Union organizers are not permitted to enter Logan County, if the fact becomes known to the coal operators.

"Representatives of the union are not permitted to hold meetings in Logan County for the purpose of inducing miners by peaceable and orderly methods to join the union.

"Coal companies maintain an army of armed guards in the Logan County fields whose principal business it is to keep the union out by whatever means they may choose to employ. It is a common practice for these armed guards to assault, beat up, shoot and otherwise mistreat union members and men who wish to join the union. In other words, it is the business of these guards, armed with high-powered rifles, revolvers and blackjacks, to 'eliminate' union men. And for many years past this process of 'elimination' has left a bloody trail all over Logan County.

Right of Free Speech, Union Says, Is Withheld

"The constitutional right of free speech and free assembly does not exist in Logan County where these armed thugs hold sway.

"None of these armed guards are ever punished under the law for the crimes they commit against coal miners and members of their families, because coal companies dominate the courts, elect and control public officers, run the elections and do as they please.

"Deputy sheriffs in Logan County are not paid out of county funds but they are paid with money donated to the sheriff by coal companies and coal operators. In 1920 these coal operators furnished the sheriff of Logan County $46,630 for the payment of deputy sheriffs and in 1921 it was $61,517.

"Coal companies do not hire armed guards for the protection of company property but for the 'elimination' of union miners and union organizers.

"Armed guards and deputy sheriffs arrest union members with or without reason or cause and throw them in jail at Logan, where many of them have been brutally mistreated. Union men have even been killed while thus held prisoners in the jail. Men are arrested and jailed for no reason except that they are union members or are found giving encouragement to the union.

"The relation of miners to their employers has by judicial decision or interpretation been established as that of servant to master, and under such decisions miners and their families have been evicted from their homes without notice and without any consideration of mercy or decency.

"The miners in a large part of the non-union section are coerced by the use of anti-union contracts known as 'yellow-dog contracts.'

"These are but some of the outrages that are committed in Logan County as a means of keeping the miners' union from obtaining a foothold in that field. The list could be lengthened by the recital of almost unbelievable atrocities, but we do not feel that it is necessary to do more than call the attention of the commission to the situation and that the commission itself will realize that something must be done in Logan County and certain other counties in West Virginia if the coal industry is to be stabilized and placed on the level where it should be.

"Obviously, such conditions as exist in Logan County and certain other sections of the West Virginia coal-mining fields contribute to the general discontent and unrest that is evident today. It is equally apparent that the influence of these conditions cannot be hemmed in by the boundary lines of the State of West Virginia. The situation in West Virginia is notorious throughout the United States. It is well known to miners everywhere, and they naturally resent such treatment of their fellow workers of that state. It is a condition provocative of indignation and strife. It should not be allowed to continue. We believe this commission should find out just how the Logan County and West Virginia situation affects the coal-mining industry for, if the commission can find a way to put a stop to the practices that prevail in that field, it will take a long step toward the establishment of industrial peace on a permanent basis.

Suggests Calling of Informed Witnesses

"We suggest that the commission examine those parts of the testimony bearing on this subject which was taken by the Senate Committee on Education and Labor in the fall of 1921 at hearings upon Senate Resolution No. 80, and read also the divided report of the committee. We suggest, further, that the commission call as witnesses such persons in West Virginia and elsewhere as are acquainted with the conditions mentioned. We shall be pleased to furnish the commission a list of names of such persons if the commission so desires. In the list will be the names of numerous persons who have been victims of the Logan County system who can give direct, first-hand evidence. We also offer to the commission any other assistance that may aid the commission in ascertaining the facts.

"We do not believe the commission can gain a comprehensive vision of the evils of the coal industry without going to the bottom of the Logan County situation. Such procedure on the part of the commission will, we believe, greatly encourage a feeling among the coal miners of the country that at least there is a governmental agency that proposes actually to do something to establish permanent peace in the coal industry.

"After having made an investigation and study of conditions in the West Virginia coal fields by means of hearings and a personal visit to those fields, Senator Kenyon, on Jan. 25, 1922, made a report as chairman of the Senate Committee on Education and Labor to the Senate on Senate Resolution No. 80," which the statement quotes at length.

"The United Mine Workers of America hold firmly to the well-established principle of the right of workers to organize and deal collectively with their employers. The right of workers to organize is fundamental. It has been proclaimed and affirmed by the government, the Congress, the courts, by state legislatures, by the press, the pulpit, by civic bodies everywhere and by the public. Yet it does not exist in Logan County.

"The right of workers to organize was declared emphatically by President Harding in his inaugural address.

"When he was President, Woodrow Wilson on many occasions laid down and adhered to the principle that workers had the lawful and moral right to organize and bargain collectively with their employers.

"Theodore Roosevelt, while President of the United States in 1902, said: 'I believe emphatically in organized labor. I believe in organizations of wage workers. Organ-

[illegible] nation is one of the sources of our social and economic development at this time."

"Chief Justice Taft, before his election to the Presidency, said: 'What the capitalist who is the employer of labor must face is that the organization of labor—the labor union—is a permanent condition in the industrial world. It has come to stay. If the employer would consult his own interest he must admit this and act on it. Under existing conditions the fairest course that an employer of labor can pursue is to deal with the labor unions as the controlling force in the labor market and to insist upon dealing only with his particular employees. Time and again one has heard the indignant expression of a manager of some great industrial enterprise that he did not propose to have the labor union run his business; that he would deal with his own men and not with outsiders. The time has passed in which that attitude can be assumed with any hope of successfully maintaining it.' During the war emergency, Mr. Taft served as joint chairman of the War Labor Board, and it is interesting to note that after his experience in that work he said on Aug. 9, 1919: 'Labor unions have been necessary to secure to the individual workingman an opportunity to deal with his employer on an equality and free from the duress of the immediate want of a daily wage to demand what he regards as an adequate and just return for his labor, or to withdraw from employment.'

"And this from Charles Evans Hughes, now Secretary of State, in an address at Columbia University on Nov. 30, 1918: 'I trust there will be no more struggle in futile opposition to the right of collective bargaining on the part of employees. The recognition of the right of representation and the prompt hearing of grievances provides the open door to reasonable and just settlements. And in returning to peace conditions there should be the utmost care to preserve every possible means which has been found helpful during the war for the investigation of the complaints of labor and for the adjustment of demands.'

RIGHT OF WORKERS TO ORGANIZE CONCEDED

"Employers of importance and vision concede the right of the workers to organize. Thus John D. Rockefeller, Jr., said in the Annals of the American Academy of Political and Social Science, January, 1919: 'As regards the organization of labor, it is just as proper and advantageous for labor to associate itself into organized groups for the advancement of its legitimate interests as for capital to combine for the same objects.'

"The United States Chamber of Commerce, in its referendum No. 27, on a report on principles of industrial relations, declared: 'The right of workers to organize is as clearly recognized as that of any other element or part of the community.'

"J. S. Tittemore, a member of the employers' group in the President's first Industrial Conference, October, 1919, said: 'So far as I am concerned, I am committed in my mind and in my vote and in opinion as it is expressed by the administrative family of the American Federation of Labor, and in saying that, my friends, I do not sanction yellow-dogism.'

"Harry A. Wheeler, former president of the United States Chamber of Commerce and another member of the employers' group in the first Industrial Conference, said: 'We freely accord the place of the trade and labor unions in those organizations which the men have a right to join.'

"Harry M. Daugherty, present Attorney-General of the United States and a spokesman for the administration, declared in a speech at Canton, Ohio, on Oct. 29, 1922: 'I am not, nor have I ever been, an opponent of honestly conducted labor organizations and trade unionism. If I were a skilled worker in mill, factory or mine, I would join a union, but I would never affiliate with a union that sets its will and its constitution above the laws and Constitution of my country. In a great industrial nation such as ours, labor organizations are necessary, but they must be the right kind of unions under the right kind of leadership.'

"The labor provisions of the peace treaty affirm 'the right of association for all lawful purposes by the employed, as well as the employer.'

"Twenty-six states have enacted laws specifically legalizing trade unions and prohibiting discharge on grounds of membership therein. They are Colorado, Connecticut, Illinois, Iowa, Kansas, Louisiana, Maine, Michigan, Minnesota, Massachusetts, Montana, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, Texas, Utah, Virginia, Washington, Wisconsin and Wyoming.

"In the principles and policies of the War Labor Board the right to organize was enunciated in detail. This declaration, worked out in conference between representatives of employers and employees and given the force of law for the war emergency by Presidential proclamation, was as follows: 'The right of workers to organize in trade unions and to bargain collectively through chosen representatives is recognized and affirmed. This right shall not be denied, abridged or interfered with by the employers in any manner whatsoever.'

"Against all of these authorities and in opposition to the enlightened thought and sense of justice of the entire nation, the coal operators of Logan County arrogantly declare that their employees shall not exercise their right to organize."

Study of Waste in Mining by C. A. Allen Elicits Widespread Interest

One of the phases of the fact-finding being done by the President's Coal Commission which is exciting wide interest is that pertaining to waste in the mining of coal. This study is under the immediate charge of Carl A. Allen.

Mr. Allen was born in Colorado Springs and was educated at the Colorado School of Mines. Following his graduation he worked for four years as a mining superintendent and as a mining engineer in gold and copper properties in Colorado, New Mexico, Arizona and in the states

Harris & Ewing

CARL A. ALLEN

of Sinaloa and Chihuahua in Mexico. For a number of years thereafter he engaged in consulting work including problems of coal-mine engineering, with offices in Denver.

From 1911 to 1913 Mr. Allen was assistant professor of mining at the Colorado School of Mines, where he established a coal-mining course. In 1916 he joined the staff of the U. S. Bureau of Mines and spent a year and a half in charge of one of its mine-rescue cars, operating in the Montana and Wyoming district. In 1918 he was sent to Utah to direct the Bureau investigations in Utah, Wyoming and Idaho. An arrangement was made whereby he was engaged on a part-time basis to serve as the chief mine inspector for the State of Utah. That arrangement still is in effect. His work with the Coal Commission is being done under a leave of absence from his regular duties. Since the passage of the general leasing act Mr. Allen has directed leasing work in Utah, Wyoming and Idaho.

Coal Wholesalers Submit Detailed Reply to Nineteen Questions of U. S. Coal Commission

At a conference of the American Wholesale Coal Association with the United States Coal Commission Dec. 15 the association submitted a formal statement of its views in connection with the nineteen topics suggested by the commission. The report was prepared and presented by the executive committee and senior council of the American Wholesale Coal Association speaking for the association and for a number of coal wholesalers not members of the association, the whole constituting a large majority of the coal wholesalers of the United States. This committee estimated that there are 2,000 wholesalers in the United States with an investment of $200,000,000 employing 20,000 persons, and distributing 450,000,000 tons of bituminous coal and coke and 60,000,000 tons of anthracite coal annually. In answer to the question of profits of other persons or corporations having to do with production, distribution or sale of coal, they said "we regret that there are no extensive accurate statistics available to show the cost of wholesale distribution of coal, nor the profits realized. This condition is due in large measure to lack of uniform accounting methods, to natural reluctance to disclose details of private business, and to fear of breach of laws prohibiting restraint of trade or competition.

"From such data as are available and from general knowledge we conclude that the return on the capital involved and compensation for the risks and services performed are and have generally been reasonable. An interrogatory addressed to all in the coal trade asking, by months for the current year, and by years over the last ten years, for the gross volume and cost for the period, the gross realization and the cost of doing the mercantile end of the business, will give to the commission an absolute national answer in such shape as can be readily analyzed."

Irregular Production Laid to Three Causes

The report assigned three principal causes for irregular production:

"(1) Labor losses due to local and national strikes. This will be eliminated when labor organizations are made subject to the same laws as govern business and perhaps some considerable improvement will obtain when immigration laws are more carefully studied and intelligently applied.

"(2) Lack of demand for long-continued periods of industrial depression. Continued education through the publication of statistical reports on production, stocks and consumption will be of assistance. The wholesaler with his year-round sales and technical force is one of the most potent factors in reducing this irregularity of production.

"(3) Car shortage or transportation disability. It is a fact well known to your honorable commission that transportation disabilities in the past have been the greatest cause for lost tonnage in time of stress. To this cause also may be attributed almost entirely the instability of the market. This condition we believe is in no wise due to the faults of corporate management but is the natural result of government operation during the war period and after. We suggest that some interesting facts may be developed if the commission will inquire into:

"(a) The seasonal fluctuations of movement of all commodities and the causes therefor, including coal

"(b) The evils incident to the assigned-car practice,

"(c) The differentiation between coal and other bulk commodities in the car-distribution rules and transportation practices.

"We deal exclusively with coal after it has been mined and becomes an article of commerce," the report states. "Waste prevention is one of our chief functions. We seek at all times to educate the consumer to use the coal most adaptable to his peculiar requirements. We also endeavor to persuade the consumer to equip himself to use the coal most accessible. Among other sources of waste it is suggested that the commission inquire as to losses by: (a) Improperly loaded cars, (b) Use of defective and unfit equipment, (c) Loss in transit by pilferage, (d) Losses by rough handling of trains, (e) Loss by degradation, (f) Theoretical losses by inaccurate weighing.

Continued education of the consumer that he may know the coal best suited to his needs, having due regard to transportation conditions and freight rates was urged. Transportation losses can be reduced by:

(a) Proper loading of railroad cars, (b) Policing in transit, (c) Improved care in train operation, (d) Proper preparation of coal at the mines, (e) Frequent scale inspection and adjustment, (f) Uniform and prompt disposition of claims arising against the carriers.

"The present situation is, in our judgment, due to the unnatural conditions that prevailed during and since the Great War; inadequate transportation, strikes, and government regulations. The remedy is:

(a) A return to conditions prevailing for many years prior to the War and,

(b) Free operation of the law of supply and demand.

(c) The financing of railroads to enable them to properly equip themselves,

(d) The doing away with preferential distribution and movement of private and assigned cars;

(e) Stabilization of mine labor and readjustments of labor costs;

(f) Restoration of fluidity of car movement by removal of unnecessary reconsignment restrictions and permitting one free reconsignment to any destination as formerly allowed;

(g) Encouragement of storage by consumers, and

(h) The elimination of discriminatory freight rates where they exist.

"We believe that under these conditions competition would restore normal supply and price."

Coal Industry to Hold General Meeting in Washington Late in January

A general meeting of the coal industry will be held in Washington late in January. The decision to call such a conference was reached during the course of the meetings in Washington in which the special committee of bituminous operators, the local coal association secretaries and the government relations committee of the National Coal Association participated. The meeting will not be confined to operators maintaining membership in the National Coal Association.

During the sessions which were held Dec. 14, 15 and 16 it was emphasized that wholehearted cooperation should be given the Coal Commission. When complaints were voiced as to the intricate character of the questionnaires that the U. S. Coal Commission is sending out, they were silenced by emphatic statements from J. C. Bryden to the effect that the questionnaires had been considered carefully by the special committee of bituminous operators at a meeting with the members of the Coal Commission, at which time certain simplification was accomplished, and that further simplification cannot be undertaken. It also was revealed that there is no disposition on the part of the operators to oppose anything that the commission is doing or to interfere with the prompt enactment of the amendments which the commission has asked. It was decided that each local association would brief its own case so far as it may be necessary to explain situations peculiar to each particular district.

Farrington Re-elected Illinois President

Frank Farrington, president of the United Mine Workers in District 12, the State of Illinois, was reelected by an overwhelming majority last week. His opponent was John Hoffmaier, of Riverton, Ill., who received most support in and around Springfield and scattered votes elsewhere.

Coal Commission Will Confine Efforts to Submitting To Congress Facts and Conclusions

By Paul Wooton
Washington Correspondent of *Coal Age*

With [illegible] hangs over the President's Coal Commission like the sword of Damocles. It is believed that enough data can be analyzed to permit of a preliminary report that will have weight with the industry as well as with the public. Machinery such as the commission must set up is cumbrous. It takes a long time to get it in working order, but once in operation, a great deal can be accomplished in a short time. Chairman Hammond, of the commission, illustrates the situation by stating that the commission now is getting the "miners' eye," referring to the fact that some time must be spent underground before the human eye adjusts itself to the darkness of a mine. Then, too, the efficiency of the commission, he admitted, has been improved since the members, latterly, have provided themselves with gas masks.

Chairman Hammond states most emphatically that the commission's report will not be a "wishy-washy affair." It will contain some rather drastic suggestions, as it is believed that bold surgery is necessary if the sources of the ills of the coal industry are to be reached.

It was emphasized by Mr. Hammond and by Dr. Smith, in verbal statements to the Washington correspondents on Dec. 16, that the commission will not undertake anything that can be interpreted as mediation in wage scales. That is the responsibility of the operators and the mine workers, it was said, and while the commission will use its moral influence to induce them to get together and will emphasize to both operators and mine workers the far-reaching consequences likely to follow another strike, the commission will do nothing more than to submit to Congress facts and conclusions.

Too Many Wholesalers and Retailers

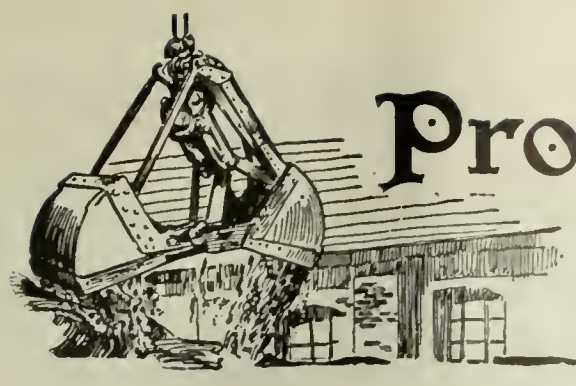
Overexpansion in the coal industry, Mr. Hammond stated, is not confined to the producers. Both wholesalers and retailers, he declared, complain because there are too many persons engaged in the wholesaling and retailing of coal. This condition adds very greatly to the burden which the consumer must bear, he said. Since the large number of organizations engaged in jobbing and retailing coal results in much duplication and the aggregate of needless overhead is large, it is not a difficult task to point out superfluous additions to the selling price, but it is difficult to suggest means whereby the eliminations can be made so that the wholesalers and retailers may be reduced in number.

John L. Lewis was before the commission for an entire day last week and conferences were had with a number of operators with regard to the wage-scale matter. As discussion of these conferences could accomplish no good purpose at this time, the commission has declined to give out any facts with regard to what was said. The operators who were called to Washington to discuss the wage-scale situation were W. K. Field, Michael Gallagher, E. M. Fenton, C. G. Hall, H. C. Adams and H. N. Taylor.

While the subpoenaing of Washington retailers in connection with a local advance of 50c. a ton in their prices for anthracite resulted in columns of publicity in the newspapers of the capital it developed nothing of material significance. Nothing which developed at the hearing indicated that there had been any profiteering on the part of the Washington dealers, although it is apparent that there is a difference of opinion as to what constitutes a fair margin for the retailer.

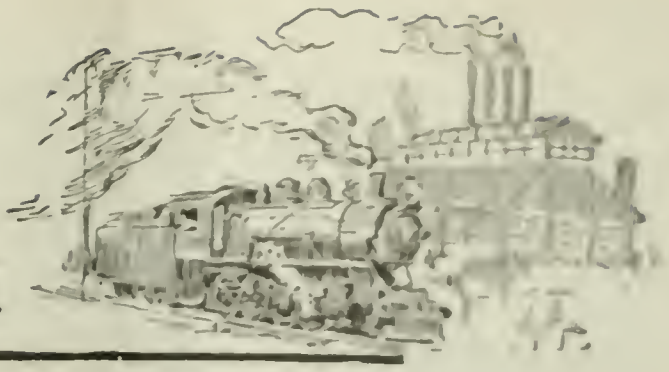
The dealers who were subpoenaed by the commission were the Allegheny Coal Co., Black Brothers, J. Maury Dove Co., W. W. Griffith, William King & Son, L. E. White Coal Co., Frazier & Co., Charles F. Miller Coal Co. and T. W. Perry Coal Co. The representatives of these companies were not at all reticent in their replies to the questions propounded by the commission, although it was apparent that they resented the fact that they were legally subpoenaed when, it is said, they would have been willing to come voluntarily.

A large delegation representing the executive committee and the senior council of the American Wholesale Coal Association appeared before the commission on Dec. 15 to submit their reply to the 19 questions asked by the commission. There was some discussion of these replies but no matters of particular significance developed. The replies submitted by the wholesalers appear elsewhere in this issue.



Those who represented the associtaion on this occasion were Seth W. Morton, president, Albany, N. Y.; J. W. Johns, vice-presdient, Pittsburgh; G. H. Merriweather, secretary and treasurer, Chicago; E. M. Platt, Chicago; George N. Dexter, New York; N. H. Swayne, Philadelphia; W. R. Coyle, Bethlehem, Pa.; R. S. Bain, Cleveland; R. K. Pratt, Boston; C. A. Owen, New York; C. F. Dunn, Detroit; Charles L. Dering, Chicago; H. J. Heywood, Toledo; C. C. McGill, Toronto, Ontario, and I. C. Cochran, Washington representative.

Would Have Railroads Operate Mines



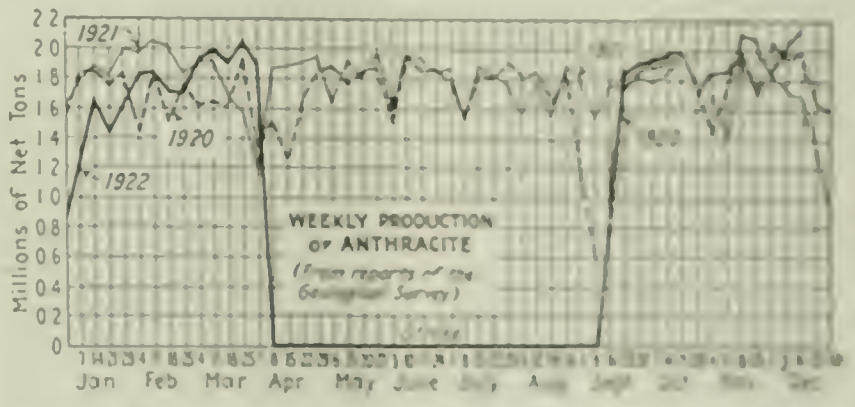
One of the most reactionary suggestions made to the commission has come from a prominent source generally regarded as being radical. The suggestion is that the coal mines be turned over to the railroads to operate. The opinion is expressed that as the railroads use 30 per cent of the coal, as it constitutes 40 per cent of the total tonnage they haul, and as transporttaion is the most important single element entering into the instability of the coal industry, the railroads could operate the mines more effectively than could the government or individual operators.

Returns from the cost questionnaires are coming in with gratifying promptness. While the great bulk of the returns received thus far are from operators conducting properties of small output, some of the larger producers have made their returns with surprising promptness. It is pointed out at the commission that it is not necessary to hold up the entire questionnaire until the information has been gathered for the whole series of twenty-one months. The statisticians welcome partial returns, as it enables them to get started on their work.

The working committee designated by the American Railroad Association to co-operate with the Coal Commission is composed of the following: G. Metzman, assistant to the president, New York Central; C. M. Shaeffer, chief of transportation, Pennsylvania; J. R. Kearney, assistant to the vice-president, Baltimore & Ohio; A. T. Owen, superintendent of transportation, Philidelphia & Reading; W. L. Booth, superintendent of transportation, Chesapeake & Ohio; D. E. Spangler, general superintendent of transportation, Norfolk & Western; W. S. Andrews, assistant to the vice-president, Southern Ry.; G. E. Evans, vice-president in charge of operation, Louisville & Nashville; G. H. Kummer, assistant freight agent, Chicago & Eastern Illinois; W. L. Barnes, general superintendent of transportation, Chicago, Burlington & Quincy; J. O. Halliday, superintendent of transportation, New York, New Haven & Hartford; C. M. Booth, freight traffic manager, Pere Marquette; C. R. Moore, general superintendent of car service, Grand Trunk; J. E. Roberts, superintendent of transportation, Delaware & Hudson; L. W. Baldwin, vice-president in charge of operation, Illinois Central; B. J. Rowe, coal traffic manager, Illinois Central; W. A. Northcutt, general solicitor, Louisville & Nashville; W. S. Bronson, general attorney, Chesapeake & Ohio; R. V. Fletcher, general solicitor, Illinois Central; M. J. Gormley, chairman, Car Service Division, and J. H. Parmelee, director, Bureau of Railway Economies. Mr. Roberts has been designated as chairman of the committee.

Production and the Market

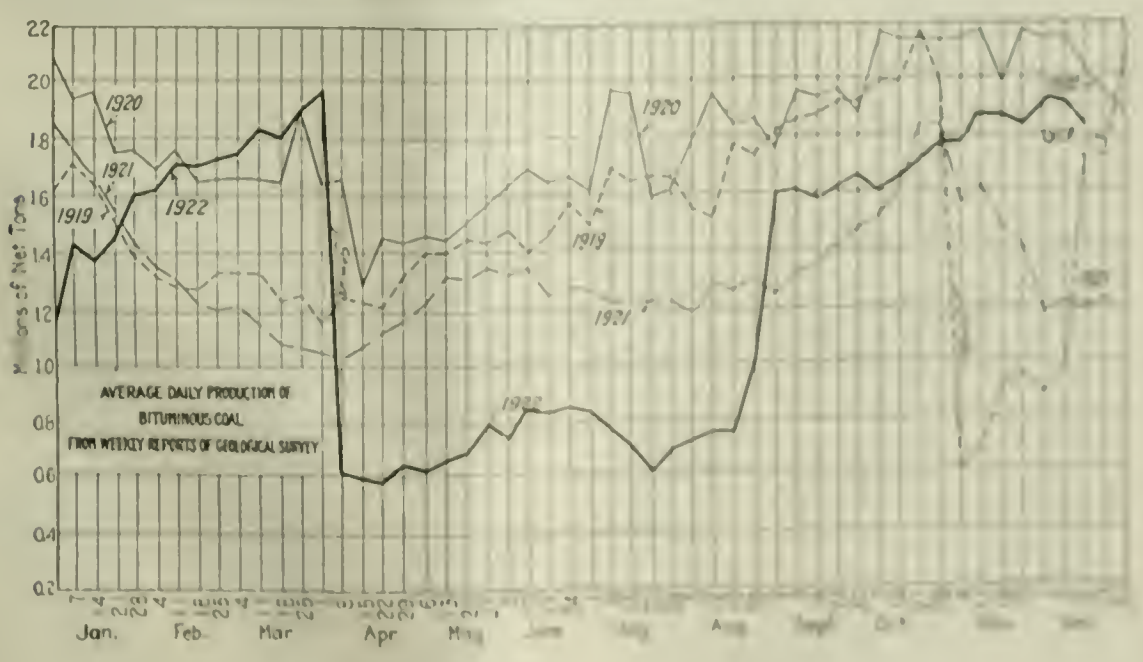
Weekly Review



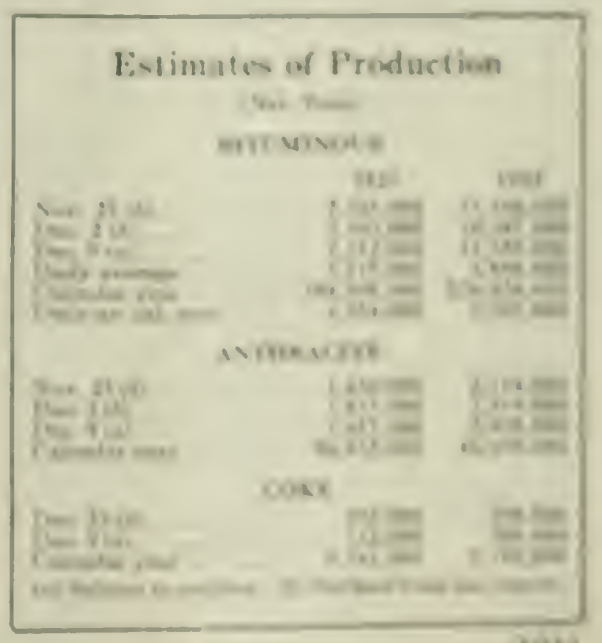
Weather conditions dominated the coal market last week. Opening with mild weather, domestic coal held firm, but the steam sizes slipped steadily downward. Near-zero temperatures came to the rescue before the week closed and caused the first definite stiffening in demand that has occurred in the last thirty days. "No-markets" quickly disappeared, car shortage became apparent at once and prices rallied from their recent slump. *Coal Age* Index of spot bituminous coal prices rose to 336 on Dec. 18, as compared with 325 on Dec. 11; the average price at the mine as represented by the index number was $4.07, an increase of 14c. over the week preceding.

Industrials Delay Orders for Market Bottom

Industrial consumers have been laying low, waiting for the bottom of the market to be reached before entering orders. At the first sign of stiffening the railroads increased their stocking movement and industries became insistent on quick deliveries of outstanding orders. There was no rush to cover by the general run of steam users—stocks are too ample for that—but there was enough increase in the call to take up the free coal that has been cluttering railroad yards, and selling conditions immediately reflected this. It is unlikely that coal will find a livelier market, however, until after Jan. 1, as inventory time presents a strong argument against heavy replenishment of reserves.



Snow and cold weather uncovered sufficient demand in the Middle West to discount the effect of the Indiana strike blow-up. Its subsidence is not now noticed in the general market awakening, although the fear of it had caused better takings of steam tonnage during the past two or three weeks. A pronounced buying of car numbers by industries, better takings by railroads and a growing call for domestic quickly placed mines in a comfortable position for the balance of the year. The same conditions exist but in a lesser degree in the Eastern Inland and Cincinnati Gateway markets, where the absorption of former Lake tonnage had been accomplished with but little price softening. A growing demand for domestic was the best feature, of course, but the steam coals also strengthened with the better buying by railroads and general consumers.

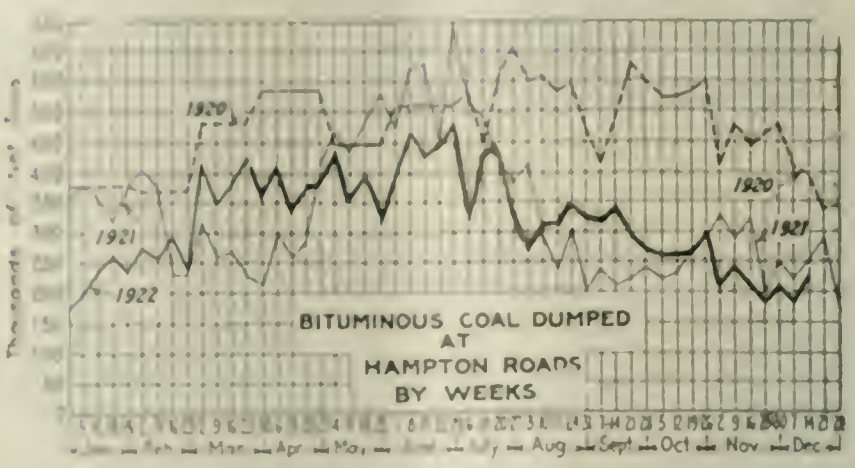


The most active market, however, is in the North Atlantic section. Cars are no more plentiful and a foretaste of crippling weather for the railroads has caused a heavy demand. Best coals are practically unobtainable and pool classifications of the lower grades have been disregarded in the buying movement that has come in on the cold wave. As usual, the light supply has released orders which have long been held in abeyance in the hope of lower prices. An important

feature in this territory is the increasing use of steel bituminous as a substitute for anthracite. The domestic market is now an attractive one for those producers who are prepared to screen their coal, and shippers are alert to the possibilities of a permanent market in these centers.

Retail supplies of anthracite have reached bottom. The trade is swamped with orders but receipts are discouragingly inadequate. In New York the edict of

the Coal Fuel Administrator reporting 61 per cent degree of consumer fuel with domestic sized has increased prices on coke and some bituminous mails. Independent roads are finding an attractive market in Canada and the regrets are commingled with those Northern buyers who offer still premiums for prompt shipment. Lackawanna has learned with the cold-weather demand and consumers, unable to obtain family sizes, are taking this as a substitute.



BITUMINOUS

Production of soft coal continues at a daily rate of approximately 1,000,000 tons. Output during the week ended Dec. 7 is estimated at 11,000,000 tons, including lignite, coal coked, mine fuel and local sales, according to the report of the Geological Survey.

Preliminary reports of cars loaded during the first four days of last week (Dec. 11-14) indicate a small decline on account of lay off in some union districts on Tuesday, miners' election day. It is expected that the total output probably will be between 10,000,000 and 11,000,000 tons.

The all-rail movement to New England declined to 2,872 cars during the week ended Dec. 9, as compared with 3,055 cars in the week preceding. That market is in fairly comfortable position as regards stocks and the recent jump in central Pennsylvania prices finds New England buyers more unresponsive.

Hampton Roads dumpings for all accounts were 257,326 tons during the week ended Dec. 11, as compared with

220,221 tons in the preceding week. Supplies at the piers are running down and shippers lack stocks to meet prompt orders.

Final reports show that tidewater business improved

slightly during November, and that a total of 2,318,000 net tons of bituminous coal was dumped over the piers at the five Atlantic coal ports. In comparison with October this was an increase of 88,000 tons. The improvement was due principally to increased dumpings for bunkers, points inside the capes, and other tonnage, which were 363,000, 357,000 and 708,000 tons respectively. Shipments consigned to New England and exports declined slightly. Cumulative dumpings in 1922 to the end of November stood at 25,760,000 tons against 34,878,000 tons in 1921.

TIDEWATER SHIPMENTS FOR NOVEMBER 1922
(In net tons)

Destination	New York	Philadelphia	Baltimore	Hampton Roads	Charleston	Total
Coastwise to New England	108,000	33,000	136,000	530,000	10,000	817,000
Exports		21,000	10,000	29,000	13,000	73,000
Bunker	180,000	25,000	17,000	136,000	5,000	363,000
Inside capes		183,000	135,000	39,000		357,000
Other tonnage	516,000		1,000	183,000	8,000	708,000
Total	804,000	262,000	299,000	917,000	36,000	2,318,000

ANTHRACITE

Production of anthracite during the week ended Dec. 9 was 2,038,000 net tons, as compared with 1,819,000 tons in the previous week. Preliminary reports for last week indicate an output of approximately 2,200,000 tons.

November production was 8,385,000 tons, exceeding the output for the corresponding month of 1920 and 1921 by 11 per cent and 18 per cent respectively. Cumulative production for the calendar year is 44,055,000 tons as compared with 84,270,000 tons in 1921 and 81,195,000 tons in 1920.

COKE

Production of beehive coke was 289,000 net tons during the week ended Dec. 9, as compared with 298,000 tons in the previous week. The decrease was principally in the Pennsylvania-Ohio region, although the Connellsville section recorded an increase.

The chief feature in the production of coke in November was an improvement of nearly 30 per cent in the output of beehive coke, which increased from 878,000 to 1,139,000 net tons. The production of byproduct coke continued to increase and reached a total of 2,908,000 tons. This was an increase of 3.6 per cent over the October record and was higher than the monthly average for any of the five years preceding.

MONTHLY OUTPUT OF BYPRODUCT AND BEEHIVE COKE IN THE UNITED STATES (a)
(Net tons)

	Byproduct Coke	Beehive Coke	Total
1917 Monthly average	1,870,000	2,764,000	4,634,000
1918 Monthly average	2,166,000	2,540,000	4,706,000
1919 Monthly average	2,095,000	1,638,000	3,733,000

Coal Age Index 346 Week of Dec. 18, 1922. Average spot price for same period $4.07. This diagram shows the trend and the actual prices on fourteen coals representative of nearly 40 per cent of the bituminous output of the U. S. Prices in actual sales first with respect to the proportions each of mine, prepared and run-of-mine normally shipped and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the years months ended June 1914 as 100 after the process adopted in the report on "Prices of Coal and Coke 1913-1918" published by the Geological Survey and the War Industrial Board.

Foreign Market And Export News

British Market Retains Activity Despite Record-Breaking Production

Production of coal in Great Britain set a new high mark for the year during the week ended Dec. 2, when 5,474,000 gross tons were mined, according to a cable to Coal Age. The output during the preceding week was 5,472,000 tons. Despite the heavy production the better kinds are scarce and the market is strong.

The approach of Christmas and a slight improvement in the European exchanges has led to better foreign buying in the Welsh market. The rather depressed state at Cardiff during previous weeks was largely due to foreign holding-off in anticipation of lower prices and better exchanges.

Some alarms are difficult to secure, namely, Durham gas and coking coals which are heavily booked. While steam coals are well booked up, smalls are still rather plentiful and weak. Owing to stormy weather there has been some delay in shipping arrivals, but as there is abundant tonnage waiting the collieries have not suffered and shipments have been well up to recent average.

Business continues to follow satisfactory lines in the Scotch coal trade, the turnover being good and prices well maintained at recent weeks' level. The foreign market is steady. There is a rather better demand in evidence for supplies to home consumers.

Export Clearances, Week Ended Dec. 9, 1922

FROM HAMPTON ROADS

For Cuba		Tons
Less 66 Tons for Trimming, for Total		2,191
For all Ports for Bunkers		1,891
FROM CHARLESTON		
For Cuba		
Less 66 Tons for Trimming, for Total		2,191

Demand More Brisk and Prices Jump at Hampton Roads

Demand was more brisk at Hampton Roads, but supplies continued to diminish, and prices took a jump. Shippers were preparing for the usual holiday slump in the movement of coal while a dull tone prevaded the market. Though the demand was livelier, shippers did not have stocks to supply it.

One cargo for South America, the first in many months, added a new angle to the trade. It was regarded, however, as simply a sporadic movement on the part of a ship which preferred this cargo going to South America light.

Coal Paragraphs from Foreign Lands

INDIA—The market, though dull, is steady. There is no inquiry from mills and railway companies. Stocks are sufficient. The latest quotationss are: Bengal first, Rs.25; Bengal good second, Rs.26@Rs.27; English, Rs.38; and African, Rs.27½.

September Consumption in France

	Metric Tons	
Coal	Sept., 1922	1st 9 mos. of 1922
Production	2,719,722	23,470,367
Plus imports	1,691,574	16,424,694
	4,411,296	39,895,051
Less exports	425,972	1,564,473
Consumption	3,985,324	38,330,578
Coke		
Production (at collieries)	80,151	717,424
Plus imports	420,921	3,721,301
	501,072	4,438,729
Less exports	46,960	337,257
Consumption	454,112	4,101,472
Briquets		
Productions (at collieries)	241,147	1,996,821
Plus imports	117,002	1,048,711
	358,149	3,045,532
Less exports	7,805	68,730
	350,341	2,976,802

The importance of French coal exports in September—524,972 tons, of which 208,430 tons went to Spain and 103,755 tons to Belgium—is a consequence of the diversion to North America of a substantial tonnage of British coals.

Demand Increases Daily; Urgent Buying Boosts Prices

Tight Market Brings Orders Awaiting Bottom Prices—Better Grades Scarce —Car Shortage Blasts Low-Price Hopes—More Transit Troubles Not Unlikely.

Demand is growing day by day and urgent purchasing at increased prices is in evidence on every hand. As usual, tight market conditions have released orders held against the time when the bottom should have been reached. Better grades are almost out of the market. Another drain on the supply has been the call for domestic coal in the East to be used as a substitute for anthracite.

Poor car supply is playing havoc with consumers' hopes of lower prices. A foretaste of wintry weather has made it apparent that additional transportation difficulties are not unlikely and buyers are seeking to cover their requirements for the next few weeks.

BALTIMORE

The market has tightened more rapidly during the past ten days than in any similar period for several months past. The demand has been growing day by day and urgent purchasing at increasing costs is in evidence on every hand.

Car supply, or rather lack of it, is playing a decided part in the situation. From the mines come reports that particular sections have been running as low as 15 per cent supply on many days, and some operations have fallen below this. At the same time both large and small consumers are on the market in increasing number and are taking up coal in many cases without regard to quality.

At this writing there are quotations from the fields for Pool 71 as high as $6. Pool 9 is bringing $5 readily and has run above that mark in several sales. The average quotation on Pool 10 is around $4.50 and on Pool 11, $4@$4.25. Unclassified coals are selling generally up to $3.75@$4. Gas lump is in demand around $4.50 and run of mine, $3.75@$4.

NEW YORK

A gradual betterment has taken place in the local market. Quotations have advanced, following an increased demand and although car supply is about as bad as it can possibly get, there is no shortage of coal, except in the better grades.

Bituminous is now being burned successfully by many persons thanks to the orders of the State Fuel Administration, who heretofore have shunned it, and it is believed will continue to be used by many, especially if it can be purchased at a lower cost than the hard coals. Quotations for the screened coals range $6@$6.75, and take the Pittsburgh or Westmoreland freight rate. This phase of the market is getting to be an important feature.

Consumers who neglected to stock up when advised to do so are now rushing into the market, only to find that the better grades are taken up.

British coals are coming forward but in small volume. Custom House reports showed that during the first five days of last week two cargoes of approximately 7,600 tons consigned to a well-known wholesale coal house reached this port. Southern coals are stronger both in prices and demand. There is a good volume moving.

Coke is steady. One house quoted domestic coke—egg and stove sizes—around $10.50 at mine, and chestnut size around $10, run of oven coke, $7.25, and foundry, $7.50. Other quotations heard included low sulphur gas coal, mine run, $4@$4.50; three-quarter, $4.50@$5; high-volatile steam grades, run of mine, $3.25@$3.75 and slack, $3 @$3.50. Other coals are quoted in the Weekly Review.

UPPER POTOMAC

Shortage of empties has affected Upper Potomac territory more than the Georges Creek district. Still, output is averaging more than in 1921. Georges Creek companies are making a little headway in speeding up production but intimidation is more or less prevalent in some sections owing to the passive attitude of authorities. Though there is not a particularly strong demand, transportation difficulties prevent prompt movement to customers.

PHILADELPHIA

There is the strongest kind of a demand, with the shipper unable to get cars fast enough to meet it, and practically all of them are back on their orders. High-grade coals grow scarcer, and pool numbers are at times lost sight of in the consumers' demand for good steam coal.

The purchaser is now quite insistent for prompt delivery and is inclined to grow impatient, especially since so many of them had expected prices to take a drop, and now that they have risen they feel they should have coal immediately. The railroads continue to absorb much of the production.

Another drain on the supply of bituminous coal has been the call for domestic in the Eastern market. Producers in position to size their output find a ready market with the anthracite retailers, getting $7@$9 a ton for the large sizes. Coke is also in strong demand. Quite a few bituminous producers are going after domestic bituminous trade with the idea of making a permanent market for their fuels, giving printed instructions as to the use of it in homes.

Prices for spot coals have materially stiffened, and under present conditions it does not seem as though the end of the upward movement is in sight.

FAIRMONT

Most mines in the northern part of the state have had to put up with a 50-per cent car supply. Operations loading railroad fuel had about all the empties they needed, mines on the Morgantown & Wheeling on some days loading nothing but railroad fuel, which constitutes the bulk of the business in northern West Virginia at present.

CENTRAL PENNSYLVANIA

Car shortage is acute and operators declare their experience is the worst known from that standpoint. One hundred and twenty-five operators attended a meeting of the Central Pennsylvania Producer's Association in Altoona on Dec. 13 to take cognizance of the situation. The preparation of the district's case to present to the fact-finding commission was left in the hands of the officers of the association.

With the exception of such operations that get the benefit of assigned cars, the mines in the district are getting only an average of one and one-half day's work a week. Operators generally, have all the orders they can fill to Jan. 1, in view of the difficulty in getting cars.

Prices range a little higher. Pool 9, $5@$5.25; Pool 1, $5.50@$6; Pool 10, $4.25@$4.50; Pool 11, $3.75@$4.25; Pool 71, $5.25@$5.50.

West

KANSAS CITY

An advance of 50c on Kansas lump and nut and of 25c on mine run was announced by several dealers on Kansas City, Dec. 14. The announcement followed three days of temperatures ranging from 5 to 20 deg. above zero, with a forecast of continued cold—the first promise of protracted freezing weather this winter.

When the drop of $1 a ton on Kansas nut and lump was announced, Nov. 22, this advance was predicted, but during the weeks the lower prices were in effect there was only a slight increase in demand. All dealers have not posted the advance.

SALT LAKE CITY

Business is quiet. Small arms are a drug on the market and many cars may be found on the side tracks. Labor is plentiful and men are almost begging for work, according to one operator.

Production for November shows up well. The figures are 880,000 tons compared with 816,750 tons for November of last year. In 1920, 936,000 tons were mined. The total production for the first eleven months of the year is 4,373,470 tons. In 1921 the total for the year was 4,606,204 tons.

DENVER

A snow storm on the western slope of the Rockies blocked traffic shutting off cars from the coal districts. Practically all mines in Colorado including the Crested Butte mines of the Colorado Fuel & Iron Co. are shut down. As a result the freight car situation is more than 50 per cent improved in both bituminous and anthracite fields of the state. The anthracite mines are still inactive on account of car shortage.

Anthracite

Deluge of Retail Orders Comes with Wintry Weather

Dealers Unable to Meet Demand—Domestic Receipts Gaining—New York Fuel Edict Boosts Buckwheat Sales, Firming Up Smaller Steam Sizes.

Cold weather has deluged retailers with orders. Dealers are unable to cope with the demand and while domestic shipments are being received in larger volume the use of substitutes is increasing. The edict of the New York State Fuel Administrator requiring 25 per cent substitute coal with each domestic order is boosting the sale of buckwheat and has about cleaned up all available tonnage. This also has firmed up the smaller steam sizes.

Independent coals are not being bought heavily by retailers in the Eastern section because of the high quotations. Canadian buyers, however, are offering fancy figures for prompt shipment.

BUFFALO

[illegible] increasing if fuel [illegible] increasing before the order came to cut it off so that New York City's poor would not suffer. But the natural gas supply is good yet; if it lasts there will be no real difficulty.

Buyers profess a degree of indifference because so many consumers refuse to buy substitutes.

The price of independent anthracite is going up. It has always been $12 or more at the mines, but is now in some instances bringing $14. Jobbers who are in that trade say that even at that price it is next to impossible to get any coal unless a buyer goes to the mining office and insists on car content.

The Lake trade is practically at an end. The sudden cold weather, followed by storm, has about closed the interlake passages. The last eight vessels, [illegible] tons, all cleared for Milwaukee, making 117,700 tons in December, a season total of [illegible] tons, as against 3,316,312 tons in 1921.

BALTIMORE

The situation as to hard coal is rapidly [illegible]. While November showed a decline in the number of cars shipped in Baltimore as compared with the movement in October, the premium was taken by dealers here that December would see an increase. The first half of the month has been the exact reverse and the indication now is that the December movement will fall below that of November.

With more severe weather and seasonal [illegible] the increase of shipments [illegible] for dealers to handle as usual. The chances to take care against the situation practically will be [illegible] and in many cases [illegible] meeting that consumers with hot water and steam plants use bituminous coal as a substitute. The dealers are not at all impressed in many cases with the public appeal to the gallery of a representative of the Maryland Fuel Distribution Committee who has given out interviews to the papers, stating that he would "demand 100 per cent co-operation on the part of the dealers, or know the reason why." It has been mildly suggested by some of the hard coal merchants here that the gentleman could profit better devote his energies to the purpose for which the commission was largely created, namely securing shipments from the mines to those dealers here who are without coal or who have but little.

BOSTON

Most of the retailers are dragging along on the bottom, so far as supply is concerned, and if there be further bad weather the situation will be serious. Tows have been unmercifully delayed along the coast and every shipper is far behind program. To add to the difficulties the movement from the mines to tidewater is very slow and the volume available for distribution is disappointingly small.

All-rail shipments also are discouraging. The Massachusetts Emergency Fuel Administrator has seen fit to attack in the press the management of the railroad that has made by far the best showing in New England, both rail and water routes considered, and the trade is disturbed over what it considers to be unfair criticism.

NEW YORK

Orders of the State Fuel Administrator requiring consumers to take 25 per cent substitutes with orders for domestic coals has tended to reduce the supply of buckwheat at the terminals as well as in the retail dealers yards and to tighten up considerably the supply of rice and barley. Rice is now the long size of the steam coals.

A few days of cold weather and a slight snow storm caused an increased demand for domestic coals which dealers were unable to meet. Domestic sizes are coming forward in larger volume, however, and with the increased shipments expected because of the disappearance of Lake shipments the Metropolitan area is due to receive considerable more coal.

Many dealers are not buying any more independent coals than necessary because of the high quotations. No yard has yet more than a week's supply on hand and it was the opinion of some coal men that if shipments of all kinds of fuel should be tied up by a storm or otherwise there would not be more than four days' supply on hand in the city.

The yards are being [illegible] for coal. It was said that buyers representing Canadian dealers were at the mines offering $14@$15 for domestic coals. The larger independents are holding close to the $10.50-market.

The good grades of buckwheat are bringing better prices than company circular and some were being offered it was said at about $7.75 alongside.

PHILADELPHIA

An event in the market this week was the sudden demand for buckwheat as a domestic fuel, which about cleaned up all available tonnage. For several weeks past, after having been laggard since summer, this size began to improve in demand, but the climax was just reached this week. Independent coal quickly went to $4 and over, quotations as high as $4.75 being heard. Companies have no more room for new business. The sudden demand has been due to the winter weather, as when the dealers could no longer supply larger sizes the public simply took what was to be had.

There has also been a strong domestic movement of all kinds of fuels, including mine run and sized bituminous, and various kinds of coke, all of which have been finding a ready market. Retail prices on bituminous coal run $9 @$16 a ton, as some of the sized bituminous is just as costly as anthracite.

If anything there has been a slight improvement in anthracite shipments, but it is too early yet to note the effect on the market. In the steam sizes rice and barley have of course showed additional strength, due to the run on buckwheat, and most shippers are able to move heavier tonnages at company prices.

South

BIRMINGHAM

Demand was a little better within the last week, railroads buying some tonnage in the spot market for stocking to carry them through the holidays, and a little improvement also was reported in the general demand from industrial sources. Current orders together with contracts are sufficient to move all the coal being mined at this time. Activity in the domestic market is more marked with a recurrence of cooler weather, the demand for household fuel being regulated pretty much by the thermometer readings. Regardless of the fact that yards are yet without stocks of consequence there seems to be little uneasiness due to this condition.

Buying has not been stimulated sufficiently to affect prices and quotations are the same as a week ago.

Car supply continues bad, averaging from 50 to 60 per cent of equipment ordered by the mines. Production is at the rate of about 345,000 tons per week, which has been the basis of operation for several weeks past. Indications point to steady work through the holidays, with the loss of only Saturday preceding Christmas and Christmas Day.

VIRGINIA

Production in southwest Virginia decreased steadily during the first part of December, due to failure of the railroads to supply enough empties, which has reduced production to approximately 130,000 tons a week, or about 46 per cent of possible production. A number of mines have increased their coke output in order to curtail idleness.

Chicago and Midwest

Real Winter Wakens Whole Coal Market

Brisk Demand for Steam and Domestic Is Held Down by Shortage of Cars—Prices Strengthen Some—Blow-Up of Indiana Strike Is Noted Widely.

General market improvement was noticeable throughout the Midwest during the past week. The real winter which has clinched into the countryside is having its effect on almost all coals from big lump and anthracite down to slack. The ever-present affliction just now is a short car supply. In Illinois, Indiana and Kentucky, most railroads have given less than 35 per cent service during the last ten days and this limits output to a point where even the lowest grade coal is in some demand at slightly ascending prices.

A pronounced movement to stock by railroads and industrials takes all the steam coal there is. This, plus comparatively light production, is the reason why the price of screenings is following domestic sizes on the upward trend. The flattening of the threatened strike in Indiana had not had time by the end of the week, to have its full effect. There is no doubt that a general rush to buy was started two weeks ago in the Indiana market territory. Its subsidence now probably is absorbed in the general awakening of trade.

CHICAGO

The market on all coals picked up noticeably during the past week here. Domestic trade was lively all through the week because of the wind and cold, thus giving the producers of second grades of domestic sizes a chance to stiffen up their prices and collect. Prices on best southern Illinois stayed at $5.50 for lump while central Illinois got strong at $4@$4.50 and pushed hard for a rise to $5. Indiana domestic coals sold as fast as they could be produced. The threatened strike in that state did not develop but there was no sinking of the market as a result of this blow-up.

Steam demand freshened along with domestic. Southern Illinois screenings rose to an average close to $2.75 and showed signs of going higher. The steam sizes from other fields displayed the same tendency, though Standard district and Fifth Vein Indiana screenings remained under $2. A little stocking is going on now.

There has been no marked car or railroad power improvement in any of the fields tributary to this market so that supply has hardly kept up to demand. The stocks of coal on hand in industrial storage yards as well as dealers' bins are small. Thus the countryside has nothing upon which to fall back if a heavy snowstorm were to hit this section tying up traffic.

WESTERN KENTUCKY

Car supply in Western Kentucky has slumped, and reports through Dec. 11 show an average for the month of 30 per cent on the Illinois Central, 19 per cent on the Henderson and 26 per cent on the O. & N., divisions of the L. & N.

Short car supply along with cold weather has resulted in prices quoted being a bit higher, as a result of increased demand of utilities, industrials and retailers. Retailers are meeting with the best business of the year, and are ordering freely. Quotations reported from some operators are considerably higher than the general market, and are perhaps shaded a bit in acceptance of business, as open market quotations are not so much higher than those of last week, screenings showing decided improvement, with lump 25c. a ton higher than the low of last week, while mine run is unchanged.

Present quotations show screenings $1.65@$2, as against $1.25@$1.75 last week; mine run, $2@$2.50, unchanged; lump, $3.75@$4, as against $3.50@$4 last week. Some 6-in. block is quoted at $4.50.

ST. LOUIS

Domestic showed a little activity the past week on account of colder weather, but this was only temporary and the call was for cheaper grades of coal. Dealers still have their bins full, principally of high grade coal for which there is little or no demand. During the past week between 25 and 50 cars of anthracite and a few cars of smokeless moved in and is in good demand. Smokeless retails at $14.50@$15, and anthracite, all sizes, $16.25.

Locally coke is scarce, but a good tonnage of Alabama byproduct is moving through this gateway, principally chestnut for base burners for country dealers. Country demand for domestic is light on account of a feeling that prices will come down.

Some railroads are anticipating storage, principally the Frisco. It is understood the Missouri Pacific has about 84 days coal ahead. The Mobile & Ohio has acquired a good storage pile at various points. Shipments for Northern roads are noted passing through the gateway indicating fairly good storage supplies going to other lines.

Retail prices are: Carterville, $2.50; Mt. Olive, $7.50; Standard, $6@$6.75. Coke is $12.50 for byproduct and $12 for gas house.

LOUISVILLE

The coldest weather of the year settled over Kentucky on Dec. 14, when the thermometer dropped steadily, to a temperature lower than ten degrees above zero that night. Retailers on Monday reported good demand, while on Tuesday morning they had so many orders that by 10 o'clock they were taking orders for Wednesday alone. This indicates small stocks in hands of consumers, and leads to the belief that there will be a good domestic business all winter.

There has also been better steam plant demand, while utility, railroad and general industrial buying has been a shade better, as a result of improvement in consumption. The western Kentucky market was nervous the early part of the week over a threatened Indiana strike. Unless the supply improves it is believed that heavy demand and short supply will force a stiffer market soon.

Prices quoted in this market, mine eastern Kentucky prepared at $4@$7.50 a ton, according to size and quality; mine run, $3@$3.50 according to size or steam and general quality, and screenings, $2@$2.50. Western Kentucky lump is $3.75@$4, mine run, $2@$2.50 and screenings, $1.75@$2.

It is reported that slightly better shipments of river coal are in prospect, while tonnage moving by barge from Kentucky River mines, to Louisville, a new development in this field, is picking up steadily.

INDIANAPOLIS

Weather hovering slightly above the zero mark tumbled the domestic consumer into the lap of the retail trade last week. Coal bins which never had more than a ton in them during the past few months suddenly went empty and for 48 hours after the blizzard struck the dealers were kept busy supplying the demand. There was a noticeable tendency on the part of the consumers to buy in two- and three-ton lots, something that has not been noticed much this winter thus far. Even with the increased buying there appeared to be no strengthening in prices.

SOUTHERN ILLINOIS

Cold weather the past week has caused an improvement in the movement of domestic sizes. The steam advanced 25c. per ton. Generally, however, winter has not been severe enough yet to bring the market up to normal. The association operators still maintain their price of $4.50 for domestic sizes, whereas the independents are still down to $3 for nut and $3.50 to $4 for lump and egg, and screenings $2.75@$3.25.

Railroad tonnage the past week was usually good. Just as soon as locomotive coal the car shortage began to loom up and the demand the previous week was caused chiefly on account of no cars, whereas a week ago it was no bids. The Illinois Central has averaged but 20 per cent supply lately. The B. & O. and L. & N. are little better.

Similar conditions exist in the Jackson County and Duquoin fields. A fairly good tonnage of domestic coal is moving out of the Mt. Olive field to St. Louis, Chicago and the Northwest. Steam coals are in good demand, with 3-in. and 6-in. screenings $4 and the mine-run $3.50@$4 (the exception of lump, which is a little heavy).

The Standard situation showed no improvement. Mines still have a surplus of coal on hand, some mines being down as much as three days a week for want of cars. Two-inch lump coal, the leading size, is $3.50 mined, but $3.75 and screenings mined up from $1.75@$2 to $2.25@$2.50. Railroad tonnage out of this district has been fair the past week but car shortage is getting serious.

Eastern Inland

Boreas Stimulates Market; Unfilled Orders Increase

Steam Market Steadies, Spot Offerings Absorbed—Railroad, Industrial and Domestic Buying Heavier—Car Shortage Acute, with Little Improvement in Sight.

The steam market steadied last week, and spot offerings, troublesome a few days ago, have been largely absorbed. Railroads have increased their purchases and large industrials followed their lead. Colder weather has stimulated the domestic market and unfilled orders are increasing.

Cars are very scarce and there is little chance of immediate improvement. Snowfall and lower temperatures have further affected transportation conditions and several of the lines serving the fields supplying this territory have become badly clogged with loads.

CLEVELAND

Domestic coal consumers are preparing to substitute bituminous coal for anthracite this winter, but they are holding back in laying in stocks now in the hope that more anthracite and Pocahontas will be available later.

Industrial plants are buying for immediate requirements only and most of the manufacturing concerns are fairly well supplied. The hand-to-mouth buying of industrial steam coal is tending to limit market activities and to cause some price recession. More steam coal is being used by the railroads than by any other class of customers, with public utilities also taking a fair amount.

Colder weather is causing dealers to stock more freely. The recent heavy snowfall brought a flood of inquiries from consumers who decided against holding out longer for anthracite supplies. Shortage of gas in the last few days has driven many domestic users to order coal. As this is a fuel-coal state, most domestic users are equipped to utilize bituminous to supplement the fading gas supply in cold-weather periods.

Retail dealers are beginning to receive Pocahontas from the mines which had been ordered six to eight weeks ago. They are obtaining Pocahontas mine run at $5.50@$6, and lump at $6@$6.50. Because of freight rates and delivery charges Pocahontas shoveled coal is still quoted at $13.50@$14.

BUFFALO

Trade is very quiet, with prices unchanged. Any Allegheny Valley mine owner states that he is selling his output at exactly the same price as a month ago, but there has been marked weakness in some districts. Pittsburgh shippers complain that the Allegheny Valley mines have been undselling other districts, but the latter hold that Pittsburgh has been asking excessive prices.

A number of sales in large blocks have been reported lately. One shipper sold 100 cars to a single consumer, at a margin of only 15c. in the gross. This ought to help a shipper materially, yet experienced jobbers, working for permanency, prefer the course that will make the consumer a regular customer.

Bituminous prices remain somewhat unsteady at $4.75@$5 for Youghiogheny gas lump, $4.75@$4.25 for Pittsburgh and No. 8 steam lump, $3.25@$3.50 for mine run and $2.75@$3.25 for slack, with slack not as strong as sizes, adding $2.09 to Allegheny Valley and $2.24 to other coals for freight.

PITTSBURGH

Free steam coal, which had a tendency to press on the market a week or ten days ago, has been largely absorbed by some good-sized railroad purchases and the steam coal market is distinctly steadier, though prices are not quotably changed.

Gas coal is easier in tone, on the whole, being bought without difficulty, more frequently at $3 than at $3.25. Some operators, however, will not touch these figures, having $3.75 in mind as their minimum, preferring to confine their production to contract shipments. Few if any monthly adjustment contracts were fixed at less than $3.75 for December.

There is scarcely any demand in the open market for byproduct coal, consumers being taken care of by contract shipments. Contracts involving a monthly adjustment have been adjusted at $3.50@$3.75 for December.

Demand for domestic lump continues very heavy and scarcely a day passes without considerable unplaced tonnage being carried over. Prices up to $5.50 are still being secured sometimes, but in general prices are lower, at $5 or less. Producers with regular customers are obtaining somewhat less, on an average. The Pittsburgh Coal Co. has adhered to $4.50 as its price right along, despite higher prices obtainable, and it is reported now that the company contemplates reducing its price to $4 shortly.

EASTERN OHIO

The visitation of heavy snowfall and lowering temperatures have stimulated considerably the demand for coal. Likewise, car supply and transportation conditions have been adversely affected. Several of the lines serving Eastern Ohio are pretty well clogged with loads.

The district produced during the week ended Dec. 9, 341,000 tons or approximately 55 per cent of rated capacity. This tonnage is about the same as that for the preceding 5-day week but is 41,000 tons above the output for the corresponding week last year.

At the current rate of production over 40 per cent of output is going to the railroads for fuel, not only to take care of their present increased needs but for storage purposes to safeguard against winter emergencies.

Considerable optimism prevailed a few weeks ago that with the closing of Lake navigation car supply at the mines would show immediate improvement. On the contrary, cars are apparently being loaded to destinations farther away from home, and instead of the car supply situation showing improvement, it is, if anything, growing worse.

Cleveland industries and retail yards received a greater quantity of coal during the week ended Dec. 9 than during any week on record, total receipts being 3,028 cars. Of this, 2,160 cars were consigned to industries and 868 cars to retail yards.

DETROIT

With the season of Lake navigation at an end, a freer movement of bituminous coal to all-rail markets is expected. The increase in supply, so far, has not materialized to any noticeable extent.

Detroit is now receiving a fair amount of bituminous, though shipments are not as great as in recent previous years. A heavy snowfall Dec. 13 exerted a retarding influence on the movement, while lower temperatures imparted a short-lived stimulus to buying, particularly by household consumers. There is virtually no free coal on tracks around town.

Ohio mines are supplying the greater part of the bituminous coal sent to Detroit, although some improvement is apparent in the movement from West Virginia and Kentucky. Smokeless continues in short supply. Hocking lump is offered at $5.50, with egg at $5; mine run, $3.50, and nut, pea and slack, $2.75.

COLUMBUS

Colder weather has stimulated domestic demand but the steam business is somewhat indifferent. Buyers are not showing any particular uneasiness and many people are waiting for lower prices before placing heavy business.

Retail stocks are not large as a rule, but in Columbus and vicinity they are sufficient. Retailers have been doing a much better business with the lower temperatures and buying to replenish is the rule. Prices are steady at former levels with no increase following the dissolution of the fuel administration.

Reports show steam reserves of from 30 to 45 days and this is the reason for slowness in buying. Assigned cars for railroad fuel are still a large item in the commercial field and about 15 to 20 per cent of the total output goes to the carriers.

Little Pocahontas or other smokeless coal is finding its way in. Car supply is short in those fields and the usual amount of free coal for the Western market is lacking. As a result dealers are depending more and more on Ohio and the product of the nearby mining sections of Kentucky and West Virginia.

NORTHERN PANHANDLE

Car shortage is restricting output to less than half of possible production. Though the demand is not so strong, yet market conditions have not materially tended to retard production especially where mines have railroad fuel contracts, which business constitutes the bulk of the business of many northern Panhandle mines.

Northwest

Coal Shipping Season Limps to a Slow Close

Time Extension Is Cut Short by Rough Weather, Spite of Premium Freight Rates — Northwest Relies on Rails Now For Hard Coal Balance.

The shipping season to Northwest docks is practically ended. Rough weather wound it up several days before the expiration of the extension granted in order to get in more of the reluctant anthracite. Only a dozen or so cargoes were still on the way at the end of the week and the allotment of hard coal remained far from filled. Premium rates had been offered to get more shipped. Only 550,000 of the 700,000 tons promised have been received at the Head-of-the-Lakes. Much hope is placed in the railroads to bring in more.

The bituminous situation is better. Cold weather has stimulated the demand for all domestic sizes and has affected the steam market favorably too. Coal is moving out as fast as it has been coming in because dock arrivals have been disappointing all through December.

DULUTH

The last cargoes of coal arrived here early this week, and navigation closed, nearly a week before the extension time allowance on insurance expired. The reason for the early close is three fold. The weather has been most inclement, and boats have taken as much as four days from the Sault. Owners are unwilling to pay high insurance rates and it is reported that there has been a scarcity of coal at lower docks.

It is estimated that 5,800,000 tons of coal arrived here since shipments started after the coal strike terminated. About 5,250 000 tons were of soft coal and only 550,000 tons hard coal. To these figures must be added 416,000 tons of hard coal and 3,500,000 tons of soft which were on the docks at the opening of navigation.

The truest picture of conditions may be obtained more from a statement of stocks on hand Dec. 1 than by shipment figures. On that date there were 2,765,924 tons of bituminous and 145,092 tons of anthracite on the docks. None of the anthracite was strictly speaking "free coal." All is spoken for but it is doubtful where the fuel administrator will order it shipped. Last year on Dec. 1 there were 5,663,477 tons of soft and 871,196 tons of hard coal on the docks. There is more bituminous coal on hand now than was used last winter but only about one-fourth as much anthracite.

Arrivals since Dec. 1 have been small —20 cargoes of bituminous and 10 of anthracite in the last week. Coal is leaving almost as fast as it arrives. It has been stated that docks could ship out all the stocks of hard coal in three days. A meeting in St. Paul with the fuel administrator will decide the fate of the hard coal on docks here.

MILWAUKEE

The last cargoes of the season, mainly anthracite, are on the way to Milwaukee, and the record of receipts by Lake will soon be closed. Dock companies have made every effort to increase their stocks of hard coal and paid as high as $1.10 per ton as a "wild" freight rate to induce steamers to make the late run. The supply of soft coal is sufficient to tide over the winter with reasonable receipts by rail.

Prepared or screened Pocahontas, which has been very scarce, is now coming by rail. It costs the jobber about $12 per ton on track at Milwaukee, which almost puts it in the class with hard coal. Illinois and Indiana screenings have also stiffened in price about 25c., but the added costs of these two grades of coal have not been passed along to the consumer as yet.

Milwaukee will undoubtedly receive an unusual amount of coal by rail during the coming winter. Dealers report a very active demand for all kinds of coal with the advent of low temperatures. The anthracite shortage in Wisconsin is greater than was anticipated, and the state coal commissioner cautions dealers to discourage the use of chestnut size by furnace consumers, as all of that grade of coal will be needed by people using base-burning stoves.

MINNEAPOLIS

Winter weather has struck the Northwest at last hampering coal transportation. Consumption leaps materially. Yet it has shown but moderate effect upon the wholesale market. Screenings, which have been in desperate shape, have braced to some extent. A continuation of zero weather will certainly help the market for regular sizes. The better grades of soft coal have been going nominally at $7.50 mine price, but with concessions.

The conclusion of the season of navigation has brought but little additional coal for the Northwest. It had been hoped that there would be a rush of hard coal for the last few days, but there was none. There is a total of around 575,000 tons of hard coal of all kinds received on the Duluth-Superior docks for the season, against the allotment of over 700,000 tons, leaving a shortage of something under 150,000 tons. The allotment was assumed to be the absolute minimum for the Northwest.

It is proposed to get enough hard coal by rail to place out. However, there is no fear of a surplus. Not a single promise, allotment or plan for coal for the Northwest has been fulfilled this year. Hence the all-rail tonnage of hard coal may be cut to a third and the period of shipments made not to exceed thirty days.

New England

Market Appreciably Firmer, Prices Up on All Grades

Operators Recently Seeking Orders Now Stick to Business in Hand—Upward Swing May Last Through January—Equipment Shortage Disturbs.

On all sides the situation is decidedly firmer. Operators who a fortnight ago were soliciting orders are now declining to make commitments until progress is made on business already in hand. The Southern smokeless grades also are in better position than a week ago, small accumulations having dwindled until several of the agencies are pressed to clear waiting bottoms. Apparently there is to be a pronounced upward swing that may or may not last through January.

Shortage of motive power is causing grave apprehension in trade circles. On the New England roads the lack of engines is not so noticeable as on the originating lines, but it is all serious enough, and is a most disturbing factor.

At Norfolk and Newport News spot coal has tightened to a marked degree. Thus far there has been nothing like comprehensive inquiry for contract shipment, current demand being confined to the several agencies themselves. Reserves here are in reasonably good shape, and even the railroads are not likely to dip into the spot market during December. A few of the water plants made purchases, especially of rail coal, before prices advanced, and naturally they are counting on deliveries being made as stipulated. In other words, it will take a pronounced falling off in rail supply to induce anything approaching a broad market.

At Hampton Roads spot coal at Navy standard is quoted at $6, with the expectation it will go to $6.75 within a few days. There continues active demand at the West for prepared sizes, and shortage of cars is a factor in reducing shipments to the piers. Practically all the low-volatile grades in central Pennsylvania have been marked up in price during the current week. The more favorably known Cambria coals have already sold up to $6 per ton at the mines and some medium to low-averages Cambria have brought $5.50 for prompt shipment. In every direction quotations are consistently on a higher level than was the case a week ago. Other spot prices are shown in the Weekly Survey.

Cincinnati Gateway

Cold Weather Helps Trade With a Freer Car Movement

Domestic Sizes and Smokeless Holding Up in Price—Softness Develops in Steam and Byproduct Sales — Car Movement Better to Southeastern Kentucky Fields.

Domestic business crowded most of the other trading to the sidelines during the past week, due to the fact that the first signs of continued cold weather arrived opportunely. The market was rapidly growing stale under increasing movement of coals to points that this gateway either serves or is in competition with. Even the flurry over in Indiana with strike clouds in the offing did not have much of an effect and what upward movement there was in price was but momentary.

Early in the month buying by the steel plants had not been of the volume that many were led to expect, so that this force has been latent in so far as bolstering declines is concerned. Firmer prices East probably had the most beneficial effect. River business continues good with heavy tonnages arriving.

CINCINNATI

The smokeless situation has scarcely lodged toward weakness, while other lines have been affected. Mine-run and prepared are still commanding the $6 price that they have for months. This is due to the small amount that is coming in over the N. & W. and the heavy shipments east from New River. What little there is for spot sale is coming from the latter fields and the brokers who can get it are asking $7@$8 for it.

Efforts made by the traffic committee of the Hazard Coal Operators' Association has shown in a better car supply to the Hazard and Harlan fields and though this has increased proportionately the output of domestic coal there has been but little tendency to drop the price. Some egg has been selling down to $5.50 but in offering sizings is the only sign of weakness. Because of slower movement West Virginia coals for the week have held about 50c. above the northeastern Kentucky or all coals of the retailer.

There has been no change in the labor situation. The loss of 11 days a day accordingly having no effect on the prices that were established in late October and have relatively since been

LOW-VOLATILE FIELDS

New River and the Gulf

Production in the New River territory is still averaging as much as 50 per cent of capacity because of poor car supply by the C. & O. Output is two days [illegible] a week, which is insufficient for contract requirements. Demand is fairly brisk at tidewater. Dumps not as large as usual. More coal also could be marketed in the West.

Increased motive power on the Virginian is enabling that road to handle more coal loads and provide more empties, which is reflected in increased tidewater dumpings as well as in slightly increased production by Gulf mines. Scarcely any coal is moving Westward from this region. For all the spot coal possible demand.

Pocahontas and Tug River

Although Pocahontas mines are producing on a little larger scale than mines in other low-volatile districts, the car supply is keeping output at most mines at not more than a 40 per cent supply. A larger movement to tidewater than to western markets is possible owing to the prompter return of empties from the piers and owing to the fact that cars remain on the line of the home road.

Poor car supply on the Norfolk & Western, which holds Tug River production at 40 per cent of capacity, is keeping many mines in idleness part of the time. Operations have not been impeded by market developments; mines are unable to obtain enough cars to insure a satisfactory movement to Western markets or to meet the demand in the West to which much coal is usually consigned on contract. Prices do not differ materially from those of other smokeless regions.

HIGH-VOLATILE FIELDS

Kanawha

Output is so curtailed by car shortage that there is hardly enough spot coal available to make any difference regardless of market quotations. Car shortage still eclipses the market situation in interest. It is difficult for many companies to keep pace with contract orders, partly because the C. & O. is not permitting the use of its larger cars for western movement.

Logan and Thacker

The C. & O. having failed to increase car supply in the Logan district, mines are forced to operate at irregular intervals, few shipping more than two days a week. Where operations are on any larger scale, coal is stored so that there may be no delay when empties are available. It is difficult to make prompt shipment on contracts, especially in the West, since only certain classes of equipment can be used. Few companies have any free coal.

Mines in the Williamson field also are producing on a 40 per cent basis. With open tops scarce the average mine is not running over two or three days a week, forcing up production costs even in the face of lower prices. Nearly all the output of the region now available is being utilized in filling standing orders, principally for Western delivery. Where coal is sold on a spot basis the price range, for steam mine-run at least is [illegible]. It is not an easy matter, however, to get coal through to Western customers.

Northeastern Kentucky

Prices are holding up, considering general market conditions. One factor is a shortage of empties, and another is irregular operation growing out of the scarcity of empties and other transportation disabilities. Quotations on mine-run range $3@$3.50 and on lump $6@$7.

Coke

UNIONTOWN

Cold weather has not materially strengthened the coal market. The number of sales, however, has been increased substantially. The size of some of the coal orders placed this week seems to indicate that those industrial consumers are taking a lesson from past experiences and are buying more than immediate needs.

There is no general inclination on the part of consumers to anticipate railroad difficulties by laying in a surplus stock at the present market but sales for the past two months have run so greatly to the hand-to-mouth variety that the fact that one or two consumers have shifted to a preparedness fuel policy may be considered significant.

The coke market shows no change, with the exception of a strong demand from the East where heating coke is being used as a substitute for anthracite. Quotations prevailing practically all week are: Steam coal, $2.25@$2.75; byproduct, $3@$3.50; furnace coke, $6.25@$6.75, and foundry, $7@$7.50.

CONNELLSVILLE

The coke market has softened slightly. Furnace is easily available at not over $6.50, against a range of $6.50@$7 a week ago, while foundry has declined 50c. to a range of $7@$7.50.

In the past two or three days a demand has suddenly arisen from the East for coke of almost any description for domestic use. There have been relatively large inquiries in the market and off-coke has been taken freely at the various prices asked. Predictions are being made that high prices will be developed in a few days as a result of this Eastern buying. The blast furnaces are not in the market to any extent for spot or prompt coke. As to the first quarter, they have steadfastly refused to negotiate, expecting lower prices. Valley furnaces have sold foundry iron at $25, furnace, for first quarter as a backlog and it is doubtful whether $7 coke would let them out whole on such sales.

The *Courier* reports production during the week ended Dec. 9 at 127,600 tons by the furnace ovens and 75,210 tons by the merchant ovens, a total of 202,810 tons, an increase of 9,040 tons.

BUFFALO

The coke trade is a trifle firmer, but sellers think the strength will not last. Domestic sizes are hard to get. Local byproduct ovens have none to sell to jobbers, except now and then; furnaces take it all. Quotations: $7.50@$8 for Connellsville foundry, $6.25@$6.75 for furnace and $9.50@$10 for chestnut to families, adding $3.28 to cover freight.

News Items From Field and Trade

CONNECTICUT

The F. A. & D. R. Alling Co., New Haven, wholesale and retail coal dealers, recently increased their capital stock from $65,000 to $150,000.

ILLINOIS

The Carterville Coal & Mining Co., with mines in southern Illinois, Kentucky and Alabama, has opened an office at Cairo.

The Union mine of the LaSalle County Coal Co. opened Nov. 20. This mine has been closed for almost a year following a fire which burned for weeks in the underground workings. The fire defied all efforts to check its progress for many days. Finally, the fire zone was walled off and a new entry was driven around it.

The Sharon Coal Mining Co., of Georgetown, has been incorporated with a capital stock of $200,000. The incorporators are Seymour A. Rhode, Louis Clements, Robert Pettigrew and John Donaldson.

The Lake & Export Coal Sales Corporation of Illinois has taken over the output of two additional mines in Williamson County. This brings the total daily production of the company to 12,000 tons. The sales organization of the company had a meeting in Chicago recently which was followed by a dinner and theater party. Those in attendance included D. S. Gent, president; W. L. Walton, vice-president; G. H. Bridges, sales manager; T. F. Gough, city sales manager; P. C. Joquel, of St. Louis, southwestern manager; R. L. Mackay, G. E. Miller, A. D. Williams, R. E. Morris and L. J. Mellick, salesmen.

The Black Servant Coal Co. of Harrisburg, a new concern, has completed plans for the opening of a **new strip mine** on a 1,000 acre tract of land near that city. The company will install approximately $200,000 worth of new machinery and equipment. The vein is said to be 8-ft. thick and from 10 to 30 ft. underground.

Approximately $300,000 has been paid farmers in the vicinity of Hamel, Madison County, **for coal rights to a new 15,000 acre tract** which has all been tested and according to indications is to soon be the site of a large mine. While all operations during the tests on the tract were made secretly, it is thought that the work is being backed by the **Mt. Olive & Staunton Coal Co.**, which has extensive operations to the north of the site.

Fire at the Consolidated Coal Co. mine No. 8 near Herrin, recently destroyed the coal washer and other top buildings causing a loss of $50,000. The fire will cause the mine to be idle for an indefinite period during which machinery and equipment will have to be replaced.

A creditor's petition in bankruptcy has been filed in the United States District Court against the Conway Coal & Coke Co. by the Flanigan Coal Sales Co., a Delaware corporation; the Black Gem Coal & Coke Co., of Illinois, and the S. & S. Fuel Co., of Illinois. The amount involved is not stipulated. The three petitioners merely declared there is over $500 due them from the Conway Coal & Coke Co., as provided by law.

The Bituminelte Coal Co. of Chicago has options on property at Mt. Vernon, for its first big plant. Bituminelte is a substitute for hard coal made by a process using bituminous. The first unit of the proposed plant will have a 500-tons daily capacity. Machine shops for the manufacture of machines used in the process will be made there for other plants to be located throughout the country as the business is built up. Mt. Vernon was selected because of its proximity to the coal fields and railroads. It has favorable rates from 10 producing counties in Illinois as well as from mines in Indiana and West Kentucky.

A certified check for $15,000 has been handed to **John M. Brichler**, Belleville, in full settlement out of court of the claim against the St. Clair Coal and Mining Co. of St. Louis, of which he was secretary, for a share of profits which he alleged was due him. The payment was made by **Fred W. Kleine**, president of the company who also paid the City of St. Louis $7,000 in settlement of a $9,000 claim made by the city for coal alleged to have been sold by the company short weight to the city water works.

The Coffeen mine of the Coffeen Coal Mining Co. at Coffeen, Ill., **has been sold to Cosgrove and Co.** This company will operate it hereafter. It is said that the purchaser will spend at least $250,000 in improvements and within a very short time 100 men will be employed. **Ralph Mitchell**, president of the Cosgrove and Co. states that the capacity of the mine will be increased to between 2,500 and 3,000 tons a day. The new management has leases on 1,400 acres in the outer St. Louis suburban belt. The mine is served by the Toledo, St. Louis and Western (Clover Leaf) railroad. J. N. Greene will be superintendent and Harry H. Hickman assistant superintendent.

The Maplewood Coal Co., Farmington, has erected 10 houses in Covingville, Ill., for homes for miners. It will erect 10 more soon.

John S. Rogers, formerly in the claim department of the Old Ben Coal Corporation at Christopher, has accepted a position in the mine offices at Dowell, of the Union Colliery Co. of St. Louis.

The Gus Blair Coal Co. at Murphysboro, with a branch office at St. Louis, has just been formed by the man whose name the company bears. Mr. Blair has long been identified with the coal business in Jackson County and served two terms as postmaster at Murphysboro.

A new slope mine is to be sunk soon in the vicinity of Marion by **The Bradbury-Scullin Coal Mining Co.** of Marion, a new concern. While nothing definite has been announced about starting operations it is thought the mine will be in operation by late next spring at least. The company is composed of the following: William Christian, John M. Reid, Harry Bradbury and R. P. Scullin, of Marion, and Joseph Stone, of Royalton. Mr. Reid is attorney for the company at Marion.

T. S. Cousins, general superintendent of three mines of the Equitable Coal & Coke Co. at Johnson City, Herrin and Duquoin, is again able to be at his offices after being confined to a St. Louis hospital for some time.

A force of men is laying 8,580 feet of track to connect the **new mine near Alpha** with the tracks of the Burlington railroad. Four loading tracks at the mine and one track for switching purposes will be built. The capacity of the new mine will be 25 cars a day eventually. Three shifts of men are now finishing the bottom and low seams. Production is expected to start about Jan. 1.

Charges that the Superior Mining Co. of St. Louis, which dissolved June 5, 1922, **wrongfully mined and appropriated coal** owned by the Southern Coal Coke and Mining Co. are contained in a bill in chancery filed by the latter corporation in circuit court at Belleville, Ill. The amount taken is estimated at [illegible] tons, worth $200,000 underground. The bill sets forth that the Superior Mining Co. operating the Superior mine had gone further than the boundaries of their coal properties and had filed for record fraudulent maps of its operations.

INDIANA

Coal lands near Terre Haute have been acquired by the Central Indiana Power Co. and Sloan & Webster, Inc., of Marion, have been retained to design and construct a power plant at the same county.

The Jasonville Fourth Vein Coal & Mining Co. of Jasonville, has been incorporated with capital of [illegible]. The directors are Samuel Bradshaw, Delbert Hill, Ora Ellsworth and Charles E. Thomas.

The Monroe-Edwards Co. of Peru has been incorporated. The company has a capital of $10,000 and will deal in coal and other fuels. Directors are John J. Monroe, Mary M. Munro and James D. Edwards.

IOWA

The board of education of Davenport will be supplied with Pocahontas, Kanawha and Tazewell county coal for the next four months at $6.21 and $6.26 a ton, a saving said to be lower than that secured by [illegible] the city of Davenport or [illegible]

KENTUCKY

N. M. Argabrite, vice-president and general manager of the Kentucky and West Virginia Power Co., was in the field recently inspecting the progress being made on the installation of [illegible] power. At [illegible] Big Sandy has [illegible] kilowatts. A number of [illegible] are now operating on commercial power. The opening of this new [illegible] tion is believed will result in [illegible] within the next year.

S. S. Stone, of Charleston, was in Ashland recently calling upon the coal trade in the interest of the West Virginia and Kentucky coal [illegible] being organized for the purpose of exploiting the coal products of that section known as the Southern Appalachian area.

MICHIGAN

The P. Koenig Coal Co. of Detroit, was indicted by a federal grand jury [illegible] charges of getting preference shipments of coal alleged to be the [illegible] the company is said to have sold to the regular customers. [illegible] the indictment, each charging a separate offense and the penalty for each is a fine not to exceed $2,000. The specific charge is violation of the Lever act, as amended, intended to put teeth in the functioning of the Interstate Commerce Commission.

MISSOURI

The Curran Coal Co. has been incorporated at St. Louis with a capital stock of $1[illegible] and will mine and deal in coal and other fuel products at [illegible] The incorporators are C. H. Curran, W. H. Hulett and E. A. Hayden.

The Mitchell-Lovell Coal Co. has been formed at Kansas City with a capital stock of $[illegible] and will develop coal properties. The incorporators are W. A. Mitchell, A. D. Lovell, E. E. Lovell and M. C. Mitchell.

Gose & Austin, who have been operating north of Rockford, have installed a plant of coal of good quality. A shaft will be put down at once and coal prepared for commercial purposes. It is believed that a much larger vein of coal is under that [illegible] section. The [illegible] together with others, have formed a corporation with David Gose, Cora Gose, L. A. Austin and Miss Lyon Austin as stockholders.

The Otterville Mining Co., which has [illegible] at Otterville for the past [illegible] prepared for coal mining on [illegible] and after going to the [illegible] and discharged all [illegible] and abandoned [illegible] This [illegible] to operate [illegible] coal [illegible] this section.

The Parral Coal Mining Co. has been organized at Joplin with a [illegible] of $25,000. The company will mine and sell coal at wholesale and retail and also will mine and manufacture [illegible] gravel. The incorporators are [illegible] Hulett and E. A. Hayden.

Dickinson Brothers, of Kansas City, who [illegible] mine coal on the Ed Reed farm, near [illegible] have sold a commercial vein [illegible] of the coal used in that section. [illegible] Kansas City [illegible] reports that [illegible] to expand its [illegible] [illegible] Chamber of Commerce [illegible] [illegible] a [illegible] [illegible] [illegible]

The Ingersoll-Rand Company and the S. R. Dresser Steam Pump Works have opened a branch office at 514 Interstate Building, Buffalo, where the usual service may be obtained by customers of these companies.

OHIO

Visitors to the Cincinnati market recently were J. W. Dorville, sales manager for the Stonega Coal & Coke Co., Pittsburgh; Ernest W. Longstreth, of the Fayette Coke Co., Masontown, Pa.; John Greenish, of the Federal Coal Co., at Williamson, W. Va.; W. Riddle, of the State Coal Co., at Cincinnati, Ohio, and P. T. Johnson, of the Johnson Coal Co., at Shawnee, Ky. Mr. Johnson brought his annual carload of coals for the miners and their families which his company gives away at Christmas.

The Monarch Coal Mining Co. has been chartered with a capital of $50,000 to mine coal and coal near Robbins. Incorporators are Oliver Monarch, Lawrence D. Monarch, Fannie Monarch, Ethel Monarch and Frances Monarch.

The Hydro Products Engineering Co., of Cincinnati, has been incorporated with a capital of $10,000 by H. M. Cohen, Philip Greenberg, John B. Schneider, I. D. Hoffman and Thomas B. Ford.

The Tyn Coal Co., which has offices in Lincoln Inn Court, Cincinnati, was recently incorporated under the Ohio laws and sold to M. Shoemaker of the Ludlow Bank.

A branch of the J. F. Barton Coal Co., of Cincinnati, is in the First National Bank building, Cincinnati, with R. D. Quarkel in charge.

The Pittsburgh & Ohio Coal Co. has taken quarters in the Union Central building, Cincinnati.

William Howells, of the St. Paul Coal Co., Kanawha County, W. Va., and Bert Peterson, of the Kanawha Coal Co., Alderson, W. Va., were recent visitors to the Cincinnati market. H. H. Chambers, president of the Chesapeake & Virginia Coal Co., Lynchburg, Va., was a visitor recently to the branch office here.

Incorporation of a plant at Fremont, in the Sandusky County field of Ohio, by the Diamond & Western Coal Co. will provide means for the storage of 1,000,000 tons of coal a year. The plant, which will be one of the largest and finest of its kind in the world, is expected to be ready for operation next summer. Four openings are being driven and when finished will have a capacity of 2,000 tons each daily. Trackage will be provided for 1,000 cars. The plant will have a long waterfront. The coal will come down to the docks from the mines in Perry County, Ohio, and Kanawha County, W. Va.

Judge A. D. Hughes of Perry County, Ohio, recently granted an agreed order in Muskingum County, Ohio, awarding the Spring Lumber Co. judgments aggregating $18,000 in its suit against the Adamson Star Coal Co. and other defendants. The original indebtedness was for lumber sold to the principal company for the Adamson Star Coal Co. near Thornville. Liens having been given in payment for the coal shipped, referred to the corporation and a question of personal liability. When the Adamson Star Coal Co. went into the hands of receivers the property brought enough under the judgments.

PENNSYLVANIA

A quota of 700 cars is believed to have been allotted for loading anthracite during the week of Dec. 10 at the Philadelphia & Reading Railway Co.'s coal piers at Port Richmond, Philadelphia, and Greenwich Point, Philadelphia. Three cargoes were cleared by the Reading Company for Boston during the week ended Dec. 8. Two of these cargoes were brought to the piers from Delaware River points, the third was coal that had been previously stored at the piers. The cargoes cleared were 2,500 tons each.

Bituminous and anthracite coal miners will be active in the Republican ballot in Susquehanna County. There were over 600 names of miners on the petitions filed with the County Commissioners last autumn. A campaign of the miners and their friends will be conducted by cards with the Congressional ballot and Pennsylvania Reading to be used. As a result four representatives of the Commonwealth Labor Party were elected to the county board. The miners are confident of electing a majority of the county officers this year.

A further slip having occurred in the roof of the Consolidated Coal Co.'s Wilkes-Barre colliery at Port Blanchard, Pa., which closed the mine, the Pennsylvania Coal Co. has completed a new slope connecting with the Consolidated workings. The new slope is expected to be in operation by Dec. 15. The Consolidated Coal Co. has been operating its mine for the past 18 months under a lease from the Pennsylvania Coal Co. The lease has expired and the mine will be worked by the Pennsylvania Coal Co. hereafter.

The Hudson Coal Co. has completed the sinking of a new slope at Plymouth, Pa., which will be used for the mining of coal from the Dorrance vein. The new slope is 1,000 ft. deep and is equipped with a double-track railroad. The Hudson

Major Lunsford, in charge of the mines of Henry Ford, who recently acquired the mines at Twin Branch in Tug River District, located on the main line of the N. & W., and formerly owned by Dexter & Carpenter, of New York, has announced that, effective Dec. 1, it will be the policy of the company to make no profit in the company commissary or company store.

Counsel representing **Peter Radakovitch**, tried and convicted on a conspiracy charge for participating in the Cliftonville mine riot of last July, have filed a **motion to set aside the verdict** and grant the defendant a new trial on the ground that one of the jurors in the case expressed an opinion unfavorable to all defendants prior to the trial. Five affidavits have been submitted in support of the contention of counsel for the defense to the effect that on the Sunday following the verdict in the case of John Kaminski, H. H. Stoops, one of the jurors, expressed the belief that those who participated in the march should be hanged, whether they shot Sheriff Duvall or not and also that anyone connected with the trouble should be hanged.

The large tipple of the **Georges Creek Coal Co.**, near Midland, was destroyed by fire a few days ago, entailing a heavy loss. The company has not determined the origin of the blaze. Operations were suspended for a time by the Georges Creek company, but a month or more ago were resumed.

There is more activity at the present than there has been in some time at the plants of the Gauley Mountain Coal Co., in the New River field, and this company only recently resumed operations at 100 coke ovens, enabling the mines of the company to work about five days a week. Advocates of a strike held out longer at Ansted than at any other point in the New River field, but the strike is a thing of the past at this plant and few of the old men remain.

The Edward Hines coal and lumber interests, of Chicago, have just consummated a deal for the **purchase of 2,000 acres of virgin coal** in the Pittsburgh seam on Indian Run in Monongalia County. Eventually this will result in the expenditure of between $5,000,000 and $6,000,000 for development purposes. The Edward Hines interests were represented in the purchase of the coal from farmers and other owners of small tracts by C. E. Hawker, of Fairmont. It is possible that the coal land acquired will be developed and operations undertaken by one of the larger companies in the Fairmont field, though negotiations have not been completed and hence no details of such a plan are obtainable at this time.

C. A. Allen, of Salt Lake City, one of the mining engineers staff of the Bureau of Mines, has ben assigned to duty in the Pocahontas region as a representative of the Federal Coal Commission for the specific purpose of making a study of waste in coal mining, it having been decided to study that question in West Virginia first.

CANADA

A fire which broke out on the premises of the **Consumer Coal Co.**, at Hamilton, Ont., destroyed a building 200x100 ft. belonging to the company. The owners place their loss at $18,000.

Output of coal from Canadian mines during August, according to a statement issued by the Dominion Bureau of Statistics, amounted to 789,000 tons, a decrease of 69,000 tons from that of July. The output for the first eight months of the year was 7,745,000 tons, which is less by 1,571,000 tons than the average for the same months of the last three years. **Imports in August** were 12 per cent below the record for July. Imports during the first eight months of the year were 49 per cent below the 3-year average for the same period. **Exports in August** were 236,000 tons, as compared with 243,000 tons in July. The record for the calendar year was 25 per cent below the average for the eight months period of the last three years. As a result of the movement of coal during August there was available for consumption in Canada 945,000 tons, as compared with a 3-year average for August of 3,222,000 tons. For the first eight months of the year the amount available for consumption was 12,615,000 tons, as compared with a 3-year average for the same period of 19,452,000 tons.

A number of miners in the **northern Alberta coal field went on strike** Nov. 10 because the operators refused to recognize the United Mine Workers. Operators aver that 50 to 75 per cent of the men are at work, and that the majority of the mines are being worked at close to capacity. The president of district No. 18 has been in the district for some time, and has been very active. On Dec. 1 there was a parade of between three and four hundred strikers through the principal streets of Edmonton. Should the men succeed in forcing their demands, it will greatly strengthen the hands of the union in Alberta as during the strike in the southern Alberta and southeastern British Columbia fields in the spring and summer of this year, the northern field was able to supply the demand, and there was no real coal shortage.

Coal briquets from Alberta mine slack will be made in the university laboratories at Edmonton. An experimental plant has been set up for the purpose, and is now practically completed. All kinds of slack from the Edmonton mines and from mines in other parts of the province will be tried out in the plant and other materials will be tested including bituminous sands from the Athabasca region.

Stating in a recent address at Ottawa that a strike of coal miners in the United States is expected on April 1 next, **Dr. Charles Camsell, Deputy Minister of Mines**, urged further examination of the possibilities of Welsh anthracite. He also suggested using peat up to the end of October, coal from November to March, and peat again for any remaining period that fuel may be found necessary.

WASHINGTON, D. C.

In recognition of his [illegible] as **director of the Maryland Bureau of Mines, Dr. J. J. Rutledge** was tendered a dinner in Washington by [illegible] at the Mayflower who have been associated with him in his work with the Bureau of Mines, Robert Sanford, editor for the Bureau of Mines acted as toastmaster. Dr. Rutledge detailed the Maryland experiment as the result of a competitive examination.

The U. S. Civil Service Commission announces that an open competitive examination will be held throughout the United States on Jan. 24 to fill a vacancy in the position of **master electrician at the Navy Yard, Brooklyn, N. Y.** The salary is $7.40 a day. The duties consist of the supervision, management and direction of all electrical work carried on by [illegible] formation, and inspection [illegible] required from the U. S. Civil Service Commission, Washington, D. C., at any of the local offices mentioned in the notice. The [illegible] of the city.

The U. S. Civil Service Commission announces an open competitive examination for electrical engineer [illegible] Navy to [illegible] Dec. 28, 1922. A vacancy in the [illegible] position, [illegible] Chief of Engineers, War Department, at $4,000 to $5,000 a year, and vacancies requiring similar [illegible] these or higher salaries, will be filled from this examination, unless it is found in the interest of the service to fill any vacancy by reinstatement, transfer or promotion. The examination will be open to all [illegible] of the United States who have had [illegible] experience in the manufacture, [illegible] and operation [illegible] electrical [illegible].

The U. S. Civil Service Commission announces an open competitive examination for valuation engineer ($5,000 a year) and assistant valuation engineer ($4,000 a year) to fill [illegible] vacancies in the Interstate Commerce Commission. The examination will consist [illegible] of experience in [illegible] chemical and market values of commodities and real estate, development properties and [illegible]. Full information and application forms may be obtained from the United States Civil Service Commission, Washington, D. C., or [illegible] at any [illegible] U. S. civil service [illegible] of the post offices or custom houses in [illegible].

Traffic News

The I. C. C. on Dec. 7 issued Investigation and Suspension Docket No. 1620, relating to class D proportional rates on coal from West Bank-Mississippi River points to points in Iowa. The commission had ordered a hearing concerning the lawfulness of regulations and practices affecting rates and charges stated in schedules contained in a tariff designated E. B. Boyd, agent, Supplement No. 28 to I. C. C. No. A 1204. Pending a decision the commission ordered that the operation of certain schedules contained in this tariff be suspended and that the use of the regulations and practices therein stated be deferred upon interstate traffic until Dec. 13, as the hearing could be concluded within the period of suspension the commission ordered that the operation of the schedules contained in the above tariff be further suspended, and that the use of the regulations and practices therein stated be further deferred upon interstate traffic until Jan. 12, 1923 unless otherwise ordered by the commission and no change shall be made in such regulations and practices during the said period of suspension unless authorized by special permission of the commission. It was further ordered that the regulations and practices thereby sought to be altered shall not be changed by any subsequent tariff or schedule until this investigation and suspension proceeding has been disposed of or until the period of suspension and any extension thereof has expired, unless authorized by special permission of the commission.

That the divisions between carriers of rates on bituminous coal to destinations in Michigan, Ohio, Indiana, Illinois and Wisconsin should retain the same relationship as before the Interstate Commerce Commission's report in Ex Parte No. 74 is the contention of the **Baltimore & Ohio, the Norfolk & Western, the Chesapeake & Ohio and the Louisville & Nashville** railroad companies. If the divisions which existed on Aug. 15, 1920, were not just, it was due to the disparity resting in their being more favorable to the Michigan lines, the carriers mentioned contend. The changes in transportation and traffic conditions affecting the two groups of lines, that is up to and beyond Toledo, which have taken place since the early days when the divisional arrangement was made, according to these carriers, have been for the most part changes which increased to greater ratio the burden of the lines south of Toledo than that of the lines north and west of Toledo. One respect in which this is said to be pointed out, is in the matter of railroad fuel as to which the Michigan roads are having coal a little less than 100 miles haul, the expense of [illegible] coal for them. It is declared further that [illegible] increased [illegible] consideration which should be given in the balance with the increased haul of the lines south of Toledo, may not become the sole [illegible].

The Fort Dearborn Coal & Export Co. was the [illegible] in the federal court for the southern district of West Virginia against the Norfolk & Western [illegible] in the amount of $11,446.93 by a jury. This was an action brought by the coal [illegible]

Association Activities

Northeastern Kentucky Coal Association

A general meeting of the Northeast Kentucky Coal Association was held in the Ventura Hotel at Ashland, preceded by a joint meeting of the executive and railroad relations committees in the offices of the association, Gayfard Building, Dec. 7. It was one of the best attended meetings in the history of the association. The newly proposed rules for mine ratings and car distribution were thoroughly discussed, recommendations made and endorsed expressing the association preference for the plan of mine rating used by the N. & W. Ry. prior to Cir. M. Rev. 14, known as the number system, and the "round robin system" of car distribution, providing therein that on any day a mine receives cars it shall receive its full rated capacity or no cars at all, thereby giving it a full day's run in place of a part day and reduce the increased cost of production caused by a part supply on any given day. The following committee was appointed to cooperate with the general committee, and to represent Northeast Kentucky Coal Association [illegible] in all matters pertaining to the Fuel Supply Commission investigation: C. W. Cooper, general manager, Kilburn & Shoaly Creek Coal Co., Esco; [illegible], general superintendent, Edgemoor Coal Co., Isaban; R. C. Thomas, superintendent, North-East Coal Co., Pennington; Car-loader Jones, Big Elkhorn Coal Co., Ashland; E. B. Price, general manager, Consolidation Coal Co., Van Lear; [illegible], general manager, Kentucky Coal Corporation, Wayland; D. H. [illegible], secretary-treasurer, Big Sandy Coal Co., Ashland; secretary C. J. Neckamp. It was recommended that [illegible] A committee representing coal and producing county in the district was appointed to work with the Railroad Rate Commission on the assessment of coal lands in the state, with the view of equalizing valuations and reducing [illegible] in the State Tax Commission [illegible] request to lower valuations.

Obituary

James B. Robinson, age 50 years, head of the coal brokerage firm of J. B. Robinson & Co., and also prominent coal operator of Birmingham, died Dec. 10 as a result of injuries received in an automobile accident. Mr. Robinson was president of the Liberty Coal Co., Little Gem Coal Co., Bibb Coal Co. and Aetna Coal Co., and had been a resident of the district for the past thirty years or more.

E. M. Radway, 35 years of age, president of the Richvein Coal Co., of Cincinnati, died Dec. 7 from pneumonia. Mr. Radway was a New Yorker by birth and came to Cincinnati after his graduation from Williams College in 1913. When the war broke out he joined the naval aerial corps and became a first lieutenant. Later he organized the Richvein company and had met with his measure of success. Mr. Radway married a daughter of William Rowe, president of the First National Bank, and leaves a son and daughter.

W. B. Everest, general traffic manager, **Westinghouse Electric & Manufacturing Co.**, died Dec. 5 at his home, 328 Emerson Avenue, Pittsburgh, where he had been confined for one week with pneumonia. Mr. Everest was born July 3, 1868, at Newark, New Jersey. After completing his high school education he entered the employ of the United States Electric Co. at Newark N. J., which was later merged with the Westinghouse company. While at the Newark Works of the Electric Company he was chief clerk to the general superintendent of the works. In May, 1884, he was transferred to the East Pittsburgh Works, retaining his position of chief clerk. In 1895 he was transferred to the auditing department, in charge of cost, and was later appointed storekeeper and shipper, and then traffic manager of the East Pittsburgh works. In 1911 he was made general traffic manager of the company. He is survived by his widow, three daughters and one son.

James Montgomery Harcomb, aged 51, well known throughout the Canadian coal trade, is dead at his home in Ottawa. He had been connected with the coal firm of C. C. Ray, starting in as clerk and rising to be managing director of the firm.

John Irving, sales agent of the Nova Scotia Steel & Coal Co., died at Montreal on Dec. 8, aged 55 years, after a protracted illness. He had been in the service of the company since 1885 and was prominent in commercial circles.

Coming Meetings

American Engineering Council will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northeast Kentucky Coal Association will hold its annual meeting Jan. 23, 1923, at the Ventura Hotel, Ashland, Ky. Secretary, C. J. Neckamp, Ashland, Ky.

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

O-B AW-7 and AW-8 Rail Bonds Make Good Bonding Easy

A rail bond doesn't do you any good until it is installed. And it is worth just what the bonding crew makes out of it.

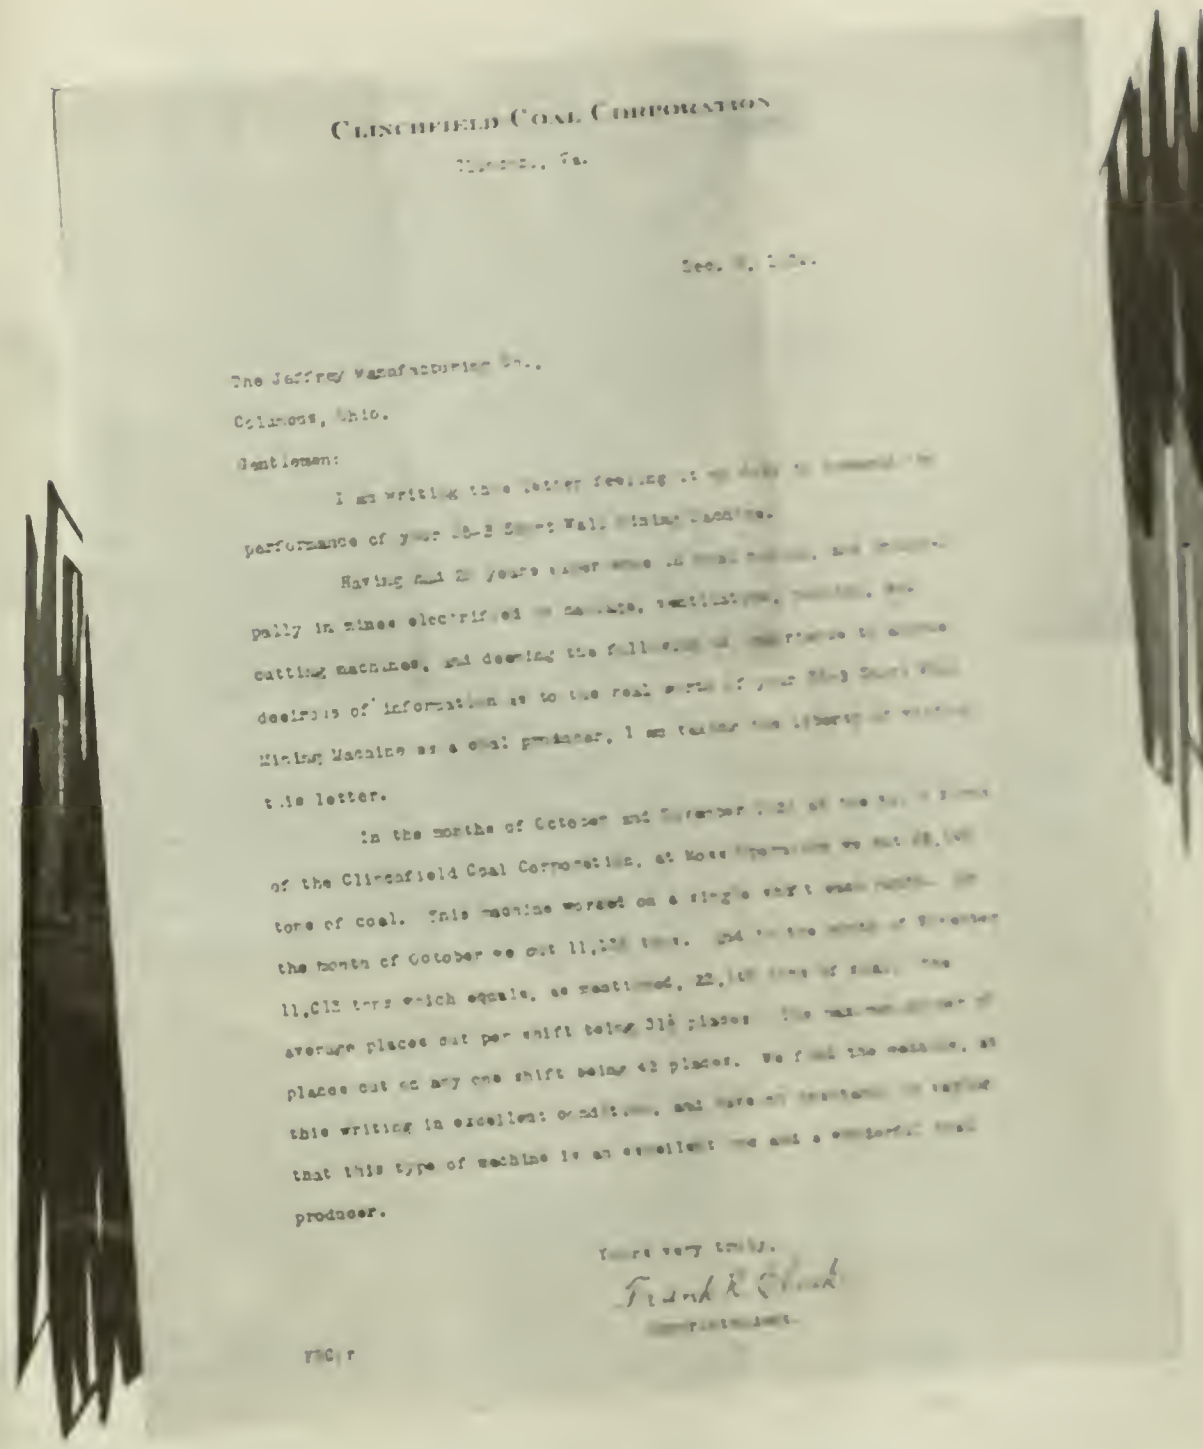
That idea guided the design of O-B AW-7 and AW-8 Rail Bonds. Every detail was so developed as to make it easy for the man on the job to do good work — to give you a 100% bond from rail to rail.

Examine an O-B AW-7 and AW-8 and you'll see what we mean. You'll find the copper strands fanned out and thoroughly welded onto a heavy steel terminal. On the track the welder joins "steel to steel with steel" — the easiest electric welding. The steel of the terminal is heavy and protects the copper.

Shape of the terminal contributes to good welding. It slopes, slightly, away from the rail so that there's a wide angle — better than ninety degrees—in which to weld.

And once installed, O-B AW-7 and AW-8 Bonds are good for long service. The steel-reinforced terminal should last as long as the rail. The copper strands—shielded from welding heat by the big steel terminal, protected by a copper sleeve which absorbs and damps vibration — survive the shock of hundreds of thousands of wheel passings.

O-B Type AW-7 Bond (Patented) Installed
It is easy to weld on all sides of the rounded terminal.



O-B Type AW-8 Bond Installed
Notice the full area weld.

O-B Type AW-7 and AW-8 Bonds improve the return circuit enough to pay for themselves and then stay on the rails to earn you a profit. Order now while you can get prompt shipment and while you have time to install them.

One Machine Cuts Over 11,000 Tons Per Month In Single Shifts

CLINCHFIELD COAL CORPORATION

Dec. 8, 1922.

The Jeffrey Manufacturing Co.,

Columbus, Ohio.

Gentlemen:

I am writing this letter feeling it my duty to commend the performance of your 35-B Short Wall Mining Machine.

Having had 20 years other mine machines, and especially in mines electrified as ours is, ventilating, pumping, haulage, cutting machines, and deeming the following statements to answer dealers of information as to the real merits of your 35-B Short Wall Mining Machine as a coal producer, I am taking the liberty of writing this letter.

In the months of October and November last of the two mines of the Clinchfield Coal Corporation, at Moss No. 3 we cut 18,140 tons of coal. This machine worked on a single shift each month. In the month of October we cut 11,212 tons. And in the month of November 11,612 tons which equals, as mentioned, 22,140 tons of coal. The average places cut per shift being 31½ places. The maximum number of places cut on any one shift being 42 places. We find the machine, at this writing in excellent condition, and have no hesitation in saying that this type of machine is an excellent one and a consistent coal producer.

Yours very truly,

Frank R. Clark

Superintendent.

FRC:r

This testimonial, which was voluntarily sent in by Superintendent Clark of the Clinchfield Coal Corporation, is an indication of the remarkable performance and the results obtained by users of the Jeffrey 35-B Coal Cutter.

A light weight coal cutter, simple in design, but rugged in structure, which is easily operated and controlled under all Mining conditions.

Write for Catalog No. 365-D, fully illustrating and describing the 35-B Short Wall Coal Cutter.

The Jeffrey Mfg. Co.

Columbus, Ohio

CEMENT-GUN
TRADE MARK

The Committee of Standardization
of Mine Timbering
of the
American Mining Congress
recently reported—

"It is recommended that:

"(4) Information on the use of gunite as a substitute for timber and as a fire-proofing or decay-resisting agent be collected and disseminated."

Therefore the following statement should prove of valve:

"Advise your friends to visit the mine of the ..... Coal Co. and see how the Gunite Coating has protected the roof on which they were formerly spending $5,000 per month in removing falls and renewing timbers."

Write us for the name of this mine and others where

GUNITE
is proving so efficient

AND here is the Compressor that is proving so efficient—the famous Traylor Portable Mine Type—with its electric motor drive—worm gearing—straight line, vibrationless operation. It never needs blocking—you just run it to place and start it going! For any and all types of pneumatic tool work. Look into THIS Compressor and you'll soon be reporting satisfaction and recommending it to all other compressor users. Send for Bulletin.

"The Waugh Way Wins"

The Saddle Test

YOU can always tell a good horseman by the way he "sits his saddle" and the same may be said of a rock drill when it is mounted on a guide shell.

THE wet Waugh 93 rides with the ease and comfort of a master horseman and this is only one of its many happy features which add no less to the efficiency of the drill runner than to the life and economy of the drill itself. You'll want 93's in your property. Just ask the nearest Waugh branch office for a copy of the "Ninety Series" booklet today.

Combination Storage Battery Locomotive with 100-A-10 Edison Cells in operation at Standard Oil Co. of Indiana, Carlinville, Ill.

Storage Battery Locomotive hauling on steady production in producing properties service.

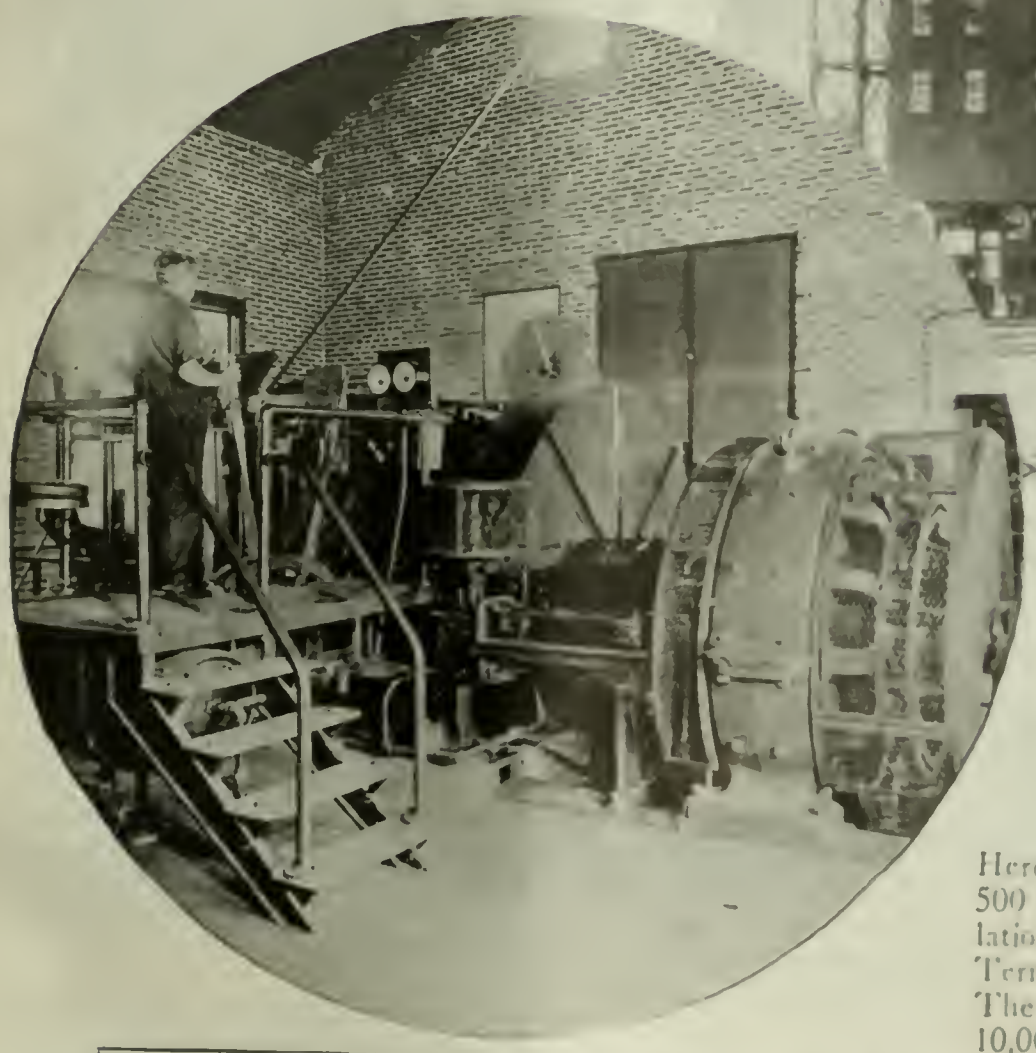
Runs in entries and headings on three feet gauge track.

Coal Locomotive pushing loads from gobs front

PRODUCTION!

The Storage Battery Locomotive increases production and reduces the cost per ton.

It gets the loaded cars to the parting and the empties back in the shortest time. It places the empties right up to the room face. The loaders are not interrupted to push or place cars and coal is loaded continuously.



The Storage Battery Locomotive is independent of any external source of power. It does not get tired, balk, or cause delay. Its services are not delayed by the repairing or stringing of trolley wire or by track bonding. It will operate efficiently throughout a full 8-hour day. With a "boost" to its battery, it will be available for emergency work. With an extra set of batteries, it can return to work immediately for another complete shift.

Wherever a man can work, the locomotive can follow him. It will operate successfully on wooden rails in the rooms if necessary. For low coal, Storage Battery Locomotives are built to go into rooms and entries where lack of head room bars mules.

Storage Battery Locomotives, equipped with Edison Batteries, operate more shifts a year and more years. They get out more coal at the lowest maintenance and operating cost which results in the lowest cost per ton.

Bulletin 608 refers especially to coal mining. Write for your copy.

Edison Storage Battery Co.
ORANGE, N. J.

500 tons per hour from a depth of 405 feet!

Here's an 850 horsepower Vulcan, hoisting "on balance" 500 tons per hour from a depth of 405 feet. The installation is at the Coverdale Collieries of the Pittsburgh Terminal R.R. and Coal Company.
The cage weighs 20,000 lbs.; cars, 5,600 lbs.; coal 10,000 lbs.; rope 2,000 lbs.

The Vulcan used here is single reduction geared with a cylindro-conical drum 9 to 15 feet in diameter. An air released, weighted engine operates two post type drum brakes. An auxiliary motor shaft brake, a Vulcan Travel and Speed Limit Device as well as other special Vulcan safety devices, complete the equipment.

The maximum rope speed is 1,560 feet per minute.

There's a Vulcan Hoist for every purpose

VULCAN OF WILKES-BARRE HOISTS

A Modern Question-Air

Number Two of a Series

Little Giant Electric Track Drill | "Universal" Air Hoist | C-P Rock Drill

"WHERE are C-P Products used?"

Little Giant Coal Drills are employed in over 249 mines, three of which use a total of 410 Little Giants.

Over 1200 Little Giant Track Drills are in daily use on street railways and in mines, with such records as—"10 to 12 times faster and 85 to 90 per cent cheaper"—and "200 holes per day; 170 more than formerly drilled by hand."

Thousands of Giant Engine horse power and hundreds of thousands of cubic feet of C-P air power are in daily use in countless industries, including numerous mines.

Other C-P products have equally enviable records.

Therefore the question "Where are C-P products used?" directly and favorably affects per ton cost—an index of their value to your mine.

"WHO makes your air compressors, gas and oil engines, hoists, rock drills, coal drills, track drills, pneumatic and electric drills and grinders riveting and chipping hammers?"

The Chicago Pneumatic Tool Company is in an excellent position to serve you—not only because its products are dependable and economical, but because, by producing a wide variety of tools and power plant equipment for mine use, *manufacturing responsibility is centralized!*

Consequently, with products as dependable as the company back of them—continuous operation, increased production and decreased per ton costs are assured.

"WHEN will delivery be made?"

Delivery of new tools and spare parts is made from large stocks carried at the nearest C-P branch—one of fifty-six branches comprising an international chain.

Back of these branches are five huge, modern manufacturing plants which assure a steady, certain source of supply of all C-P products.

Mine superintendents are, therefore, assured prompt delivery of C-P products—as dependable as the service back of them.

Keep *your* mine in continuous operation by specifying C-P.

"Teeter" talks on economical extravagance

"Jim" Robinson, the Superintendent at Coal Fork, and "Teeter" Mayo, General Manager of the neighboring Coaldale plant were in animated and highly colorful conversation. The casual observer might have been led to believe quite easily that the two were sworn enemies instead of the best of friends.

"I have been thinking for some time," says "Jim," "and—"

"Pardon the interruption," cut in "Teeter," "but tell me, 'Jim,' isn't this something a little out of the ordinary for you?"

"Your pardon is accepted, 'Teeter,' only don't try to pawn off any more of those stale Vaudeville gags on me. As I was saying before you made such a mess of trying to be humorous, I have been thinking for some time that most of your 'grief' on semi-automatic substations were 'cons.'"

"Ha! Ha! that's good too," "Teeter" came back at him.

"Well," continues "Teeter," absent-mindedly switching the cad in the right thumb over to the left, "you contend that you have no need of automatic reclosing circuit breakers because the manually-operated devices are seldom opening

The Circuit Breaker with Brains

"As soon as you've quit thinking on a flat wheel, that much sooner are the stockholders of your little organization going to realize they didn't place their hard-earned 'do-re-mi' in your plant for sentimental reasons alone. Why, Man Alive! Small wonder the breakers never come open. You have the overload yokes dropped so low on them that your motormen would have to turn the works inside out and make a stripping operation out of your plant before the breakers opened. Boy—you're suffering from an acute attack of 'over-generatoritis.' You think because you have plenty of generating equipment that it's economical to let those Kilowatt Hours scamper around loose like a bunch of dry peas in a high silk hat.

"And yet you firmly believe you are ahead of the game. That's enough to make Ringling Brothers laughing hyena go into hysterics.

"If you had the overload settings of those breakers in your station carried somewhere near where they ought to be; that is, at some current values approaching your normal mine load, they might open up once in a while and you wouldn't have such a sweet power bill to greet your nimble optics every month."

"I never saw it in quite that light before," admitted "Jim," giving "Teeter," a thoughtful and thankful gaze.

"Now if you're still a skeptic on this stuff, then make this simple test: Put an attendant in the 'sub' for a month and set the breakers so there is a ghostly chance of they're coming out. If you don't have automatics in there the next month, then the Bolsheviki have no use for bath-tubs."

The Turbinair "Scraper" Hoist

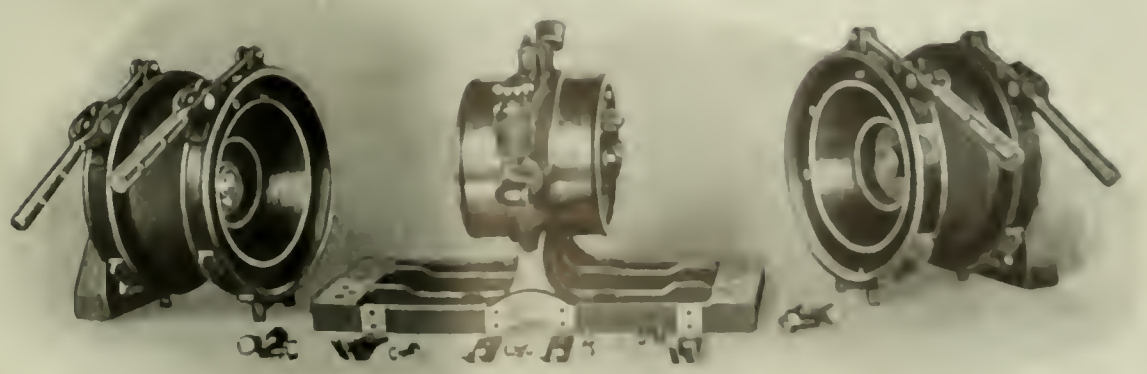
For handling scraper loaders underground, or at stock piles, this

New Sullivan Double Drum Hoist

secures rapid work with power economy and convenience.

In scraper work one drum hauls in the load, the other returning the scraper by a tail rope.

"HDA" Double Drum Hoist with Brake Bands and Handles removed for use in scraper loading



CAPACITY. The motor runs continuously, and the clutch on each drum is thrown in or out with perfect control at all times as needed. Either drum is capable of hoisting 2,000 pounds vertically on 75 pounds air pressure, the same as the single drum hoist.

CONVENIENCE. The light weight, (555 pounds) and compactness of the Double Drum Turbinair make it convenient for use in development or other work in places that are hard to get it. The hoist is bolted to a skid or timber, or mounted on a turntable if desired.

ECONOMY. The Turbinair motor provides high starting torque and is exceedingly substantial. It is economical of air at all pressures, is practically impervious to wear, and comprises no valves, pistons, jaw clutches or complicated parts.

AIR SUPPLY. The air needed for the Turbinair double drum hoist is supplied by a [illegible] inch hose, the same as for the single drum machine. This is a great advantage not only in power economy, but in convenience, since the hoist can be operated from the same air lines as any hammer drill.

Rome meets your every requirement in Mine Cables and Cords, whether for Gathering Locomotives or Mining Machines, Fans, Pumps, Motors, Portable Tools, Lighting and Power Circuits. There is not a Mine Service that cannot be met from the Rome Super Service line and we will be glad to tell you all about it.

But Rome doesn't stop there, for in Super Service Cable and Cord itself lies the greatest inducement to complete and standardized installation in your Mine. Super Service is differently built from all other insulated wires. We offer you a choice of types, but all of one quality.

Fine copper wire, stranded for flexibility, effectively insulated with close wound, tested cotton, rubber covered, over that a strong cotton braid, and over all a heavy layer of Super Service rubber, next a wound layer of tough cotton cord, finally another layer of Super Service rubber—then this built up Cord Tire construction is moulded in steel forms under tons of compression.

We have Super Service Cables and Cords for every Mine use and you get real, enduring Service from every one. Get the Data Today

This Saving Would Pay For Your VENTUBE

EVERY time they use compressed air to exhaust powder gases, you lose money. It's expensive—and it is only partially effective.

Install VENTUBE and save the compressed air for your drills. VENTUBE is a portable, flexible ventilation tubing—for both large and small mines. VENTUBE is made by the Du Pont Company, long familiar with mining conditions and the manufacture of impervious fabrics.

VENTUBE is made to *last* underground. VENTUBE stands up—it is waterproof and fungus-proof and highly resistant to all gases, acid and alkaline conditions met in mining.

VENTUBE means fresh circulating air in every working place. It comes in standard sections, ready-to-hang. VENTUBE gives every miner better working conditions and that means more tonnage.

Write for our descriptive booklet.

VENTUBE is supplied in standard lengths of 25, 50 and 100 feet and standard diameters of 8, 12 and 16 inches, with all necessary accessories. Sections equipped with Braly patent ring couplings can be coupled or uncoupled in a few seconds.

"I call for everything through the Mine Telephone—from logs to doctors"

Here's a Western Electric Mine Telephone at the foot of the main shaft at the Woodward Colliery of the Glen Alden Coal Company, the second largest anthracite coal company in the United States. This Company uses the Western Electric System in all their collieries.

"Hank" Carpenter, the mine foreman shown here, says:

"I've never known this Telephone to give any trouble, it works fine—shocks from shots don't bother it—nor does gas or moisture. I call for everything through it—from logs to doctors."

The efficiency of Western Electric Mine Telephones, Wall Sets, Switchboards and Connections is being demonstrated every minute of the day throughout the coal fields. Get in touch with us through our nearest branch.

We furnish equipment for every electrical need in the mine, line material, car parts, cables, portable tools, Square "D" Safety Switches, D & W Fuses, tape, bushings, as well as motors, generator sets and other large equipment.

No matter where you are located we can assure you of quick deliveries. There are Western Electric Distributing Houses in and near each coal field.

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 22 NEW YORK, THURSDAY, DECEMBER 28, 1922 Number 26

Stop Before Reversing

THERE are those who would thus easily remedy the situation in the bituminous coal industry of too many mines and too many miners—poof! Close up the high-cost and the small mines; concentrate men, capital and transportation on the efficient large operations. How easy that is—to say.

In its recent decision on the Kohler mine-cave law of Pennsylvania, the United States Supreme Court says: "What makes the right to mine coal valuable is that it can be exercised at a profit. To make it commercially impracticable to mine certain coal has very nearly the same effect for constitutional purposes as appropriating or destroying it." The Court goes on to say that the general rule at least is that while property may be regulated to a certain extent, if regulation goes too far it will be recognized as a taking.

An overplus of bituminous-coal mines we certainly have for present and immediately future requirements. The periodically speculative profits attracted capital and the high-unit wage rates was the magnet for the labor. Now with the mines and the men started, and in some instances fixed, in this industry and occupation, what means is there for engineering the removal of the overplus, save by a reversal of the process that brought them in? It is quite certain they cannot be legislated out of business and out of jobs.

The tendency even now is to grow and expand. Even today there is an undercurrent of protest that the Coal Commission should have given the soft-coal industry a black eye recently by calling the attention of investors to its condition of overdevelopment.

The Market Turns

TWO ELEMENTS threatened the tranquility of the bituminous-coal market when, at the beginning of September, the mines resumed operation. One was the shortage of stocks of coal in the hands of railroads and industrials, the other the necessity of replacing the millions of tons of domestic fuel lost by the anthracite strike. By careful planning, by nationwide organization of big business and appeals to buyers of coal in quantity to hold off purchases for storage, the first of these as a danger to the market was minimized. The price of steam coal dropped week by week and the small buyer waited for the bottom.

The other factor has come into play within the last three weeks. Cold weather—a real touch of winter—developed a shortage in the householder's cellar, both East and West. Prices have taken a sharp turn upward, buyers are becoming urgent. Along the Atlantic seaboard the necessity for substitute fuel is calling in from Pittsburgh and other distant points block, splint and lump, unobtainable from soft-coal fields nearer by. Incidentally this is adding to the railroad haul, tying up open-top cars and slowing down the usual turnaround.

Production of soft coal began to decline early in the second week of December. Day by day it has been falling away. The cause has not been decrease in demand, for prices are headed the other way. The cause is primarily failure of motive power on the railroads. Engines in poor condition have been no match for zero weather and fatalities on the line are reported as high. Real winter is not starting out well for him who is short of fuel.

Is There a Will to Negotiate?

BETTER business in 1923 is the prospect as the new year dawns. True it is that there is no prospect of a repetition of the boom times of 1920, but undeniably industry is gaining ground as the months roll along—the country is on an upward swing. Progress is slow, as healthy growth should be, and is being helped by a marked feeling of confidence throughout the business structure. The building revival of 1922 promises to continue with the new year; the road building programs, halted in part by the railroad strike, will be taken up again next spring. Unemployment is no longer a national menace; the coal shortage that threatened at the end of the summer has been forestalled and the situation is well in hand; the railroads are getting back on their feet; the country is coming to its senses and will help in some manner to solve the multitudinous problems of Europe. Whatever be the length of the upward swing, no matter if it be followed by another slump, the present fact is that the country is looking up. Business is mending.

One cloud hangs over the country. It is the possibility of another strike of coal miners next April. The disruption to business caused by the five months' shutdown of last summer was serious. Some curtailment of industry resulted, a railroad strike was precipitated, the wheels of industry were thrown out of gear and are but now getting back to smooth running. The country is soured on such strikes. It has caused a coal commission to diagnose the workings of the industry that has these sinking spells. The steel man, the railroad manager, the banker, the farmer, all are earnest in their desire that there be no repetition of last summer's fracas.

What are the coal operators and the union miners thinking about it? What are they going to do? That is the real question, for at this stage the public and the U. S. Coal Commission can do nothing about it. The matter is entirely out of their hands. The public if it has any concrete idea about the threatened strike of next April, turns to the Hammond commission, knowing that these men have been brought together because of a cry from the country for an investigation of the coal industry. The commission has no power and no injunction from its creator, Congress, to intervene in such a contingency. This is not a wage-negotiating body, set up to settle industrial difficulties between the coal men and their employees. It is a fact-finding body, as

1923

It is this question that must be settled before peace can be assured the bituminous-coal industry. The conference for its solution calls for no ascertainments of fact—such as profits of operators or earnings of miners, now being investigated by the U. S. Coal Commission.

What the situation does demand is an earnest will to negotiate.

When Facts Are Most Useful

AS THE date for the preliminary report of the President's Coal Commission approaches, much interest is being manifested in what the commission may say at that time. The industry recognizes that the commission is composed of men of vision who are anxious to concentrate every ounce of their influence to do something constructive and helpful. It is recognized that a communication to Congress of the findings of facts with regard to the status of wage negotiations can be handled in a way to have a profound effect on that situation even though the commission itself take no part in those negotiations.

The commission be may expected to look on this problem as if it were the organized channel through which public opinion is to be expressed. Unquestionably it is its desire to encourage both the operators and the mine workers to get together. It is believed that each side to the controversy has great confidence in the commission. Each side would be inclined to accept its findings of fact.

An authoritative statement from the commission as to its finding of fact in regard to the cost of production, even if incomplete, would be of the greatest importance to those at the wage scale conference. If additional facts could be made available as to the relative costs of production in the union and the non-union fields, it would have great significance. Any facts which the commission may announce with regard to the relative rates of pay in coal mining, as compared with those in other industries, would be seized upon eagerly by the Chicago conferees.

The operators in the union fields contend that they cannot pay the present scale and compete with non-union operations. The commission may be in a position to make some authoritative statement by Jan. 15 as to the point where the non-union costs begin to be an important factor in competition. It would be helpful also to have an authoritative statement as to whether or not non-union miners have larger annual earnings than those who draw, at times, the higher pay in the unionized districts.

These examples give an idea of the very important influence the coal commission could exert on the wage-scale conferences and it is the general opinion that all facts in the possession of the commission which may be helpful in giving the mine workers and the operators, engaged these next few months in the wage-scale conferences, authoritative data, will be put forward as they become available.

The point must not be overlooked, however, that the very incompleteness of the data that can be collected, compiled and prepared by Jan. 15 argues against the fulfillment of this ideal of immediate helpfulness. We are not to be too hopeful, for we must appreciate the handicap of time, the initial unfamiliarity of the commissioners themselves with the details of their task and the grave responsibility that will attach to any and every statement they issue.

Cutting Hoisting Costs At a Shaft With Five Levels

By Dever C. Ashmead*
Kingston, Pa.

Peach Orchard Shaft Had Two Hoists for Its Many Levels—One Hoist and One Level Station Recently Abandoned and All Coal Brought Up One Shaft—Locomotive Formerly Crossed Over Cage

WHEN engineers lay out a track system on paper they frequently fail to visualize just how it will accommodate itself to the needs of the mine. They see some of the essentials, of course, but many others, just as important, are entirely overlooked. This lack of vision is the cause of many poorly laid-out mining plants. It is to be noted not only in the general scheme of operation but also in operating details. For this reason the engineer should depend not only on his own inventiveness and imagination but on the experience of others. They also have had their difficulties and either have seen ways of correcting them or have found them sooner or later after construction was completed.

Just as soon as the plant is operating, these inadequacies in the original layout are seen. The loss of time and money becomes apparent and changes ultimately have to be made which redound but little to the credit of the designer, who naturally is made the butt of much criticism by the official in charge of actual operation.

Some criticisms of course are delayed. Everything works well until distances become longer and traffic heavier or till changes of equipment make the particular layout unsuitable. A little prophetic foresight always is an advantageous quality in the engineer. Especially is it well to keep in mind that a larger tonnage may be desired, labor may become scarce or the price of labor so increase as to make operation by the methods provided uneconomical. When all is said, however, it must be conceded that it would have been hard to forecast the progress of modern development and in many cases it would not have been prudent to do so.

Ten or twelve years ago the cost of labor was lower

*Anthracite Field Editor, *Coal Age*.

Note—The illustration in the headpiece shows No. 1 shaft of the Peach Orchard colliery of the Glen Alden Coal Co. near Wilkes-Barre, Pa. In the background is the boiler plant, the hoisting engine house, the substation and the fan house.

Ebbett Shaft Station

View of the underground side of the 2 shaft. The rail bracket out of the cage to collect coal, pushed toward the background, where a trackman receives it and drives it into the station track on the right on which the "down" or empty set is located. On the left is a passageway running around the shaft. The timber set is about 10 ft. above rail level to give room and to clear the tops of the empty

to fix these today. It was not only cheaper but more plentiful, and an extra mine or so made little difference. So the use of mechanism was not so necessary. The cost of coal was disproportionately low because the coal being mined was not only thicker but nearer the shaft. The thin beds were neglected. Less water also had to be handled. For these many reasons a

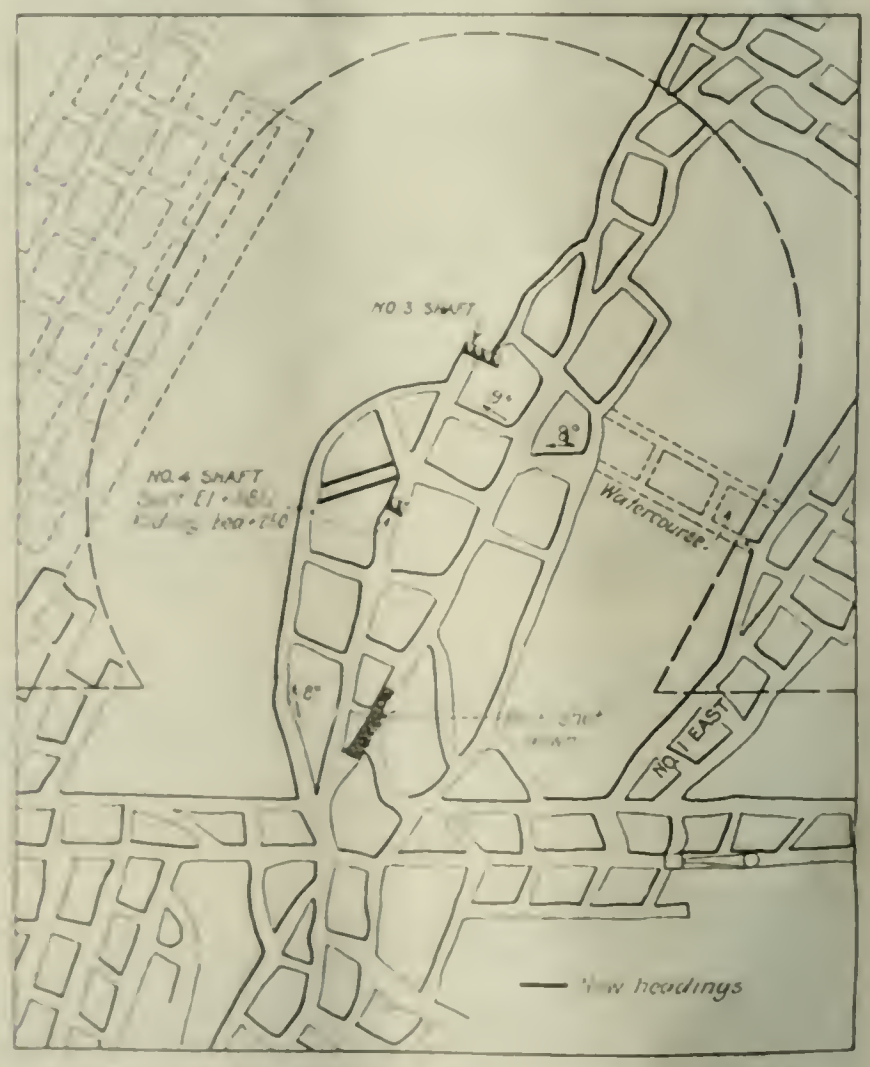
OLD AND NEW LAYOUT AT ABBOTT LANDING

The empty cars formerly collected on the side of the No. 1 shaft adjacent to shaft No. 2 and were brought back by a locomotive which had to cross the cages in order to reach them. Now a headway between the two shafts returns the cars one by one to a switch which automatically directs them to the empty pit

greater cost in handling and preparing the coal was counterbalanced by lower cost at the working face.

Many of the plants or parts of plants designed in these earlier days have recently been remodeled in order to cut down operating cost. Among them is the Peach Orchard Colliery, opened twelve years ago by the coal department of the Delaware, Lackawanna & Western R.R., since succeeded by the Glen Alden Coal Co. Two shafts were sunk for the hoisting of the coal from six different levels, one shaft being intended to hoist the coal from four levels and the other from two. To handle this coal at the underground levels seven men were required and often as extra man or even two had to be employed. Because there were two shafts five hoisting engineers had to be provided, one shaft working two shifts and the other three. Furthermore, two men were needed for dumping, one at each shaft.

Here, then, was an expenditure for the labor of fourteen to sixteen men. At the time no one considered the cost too high, but with the labor scale at its present level the waste would be considered almost criminal.

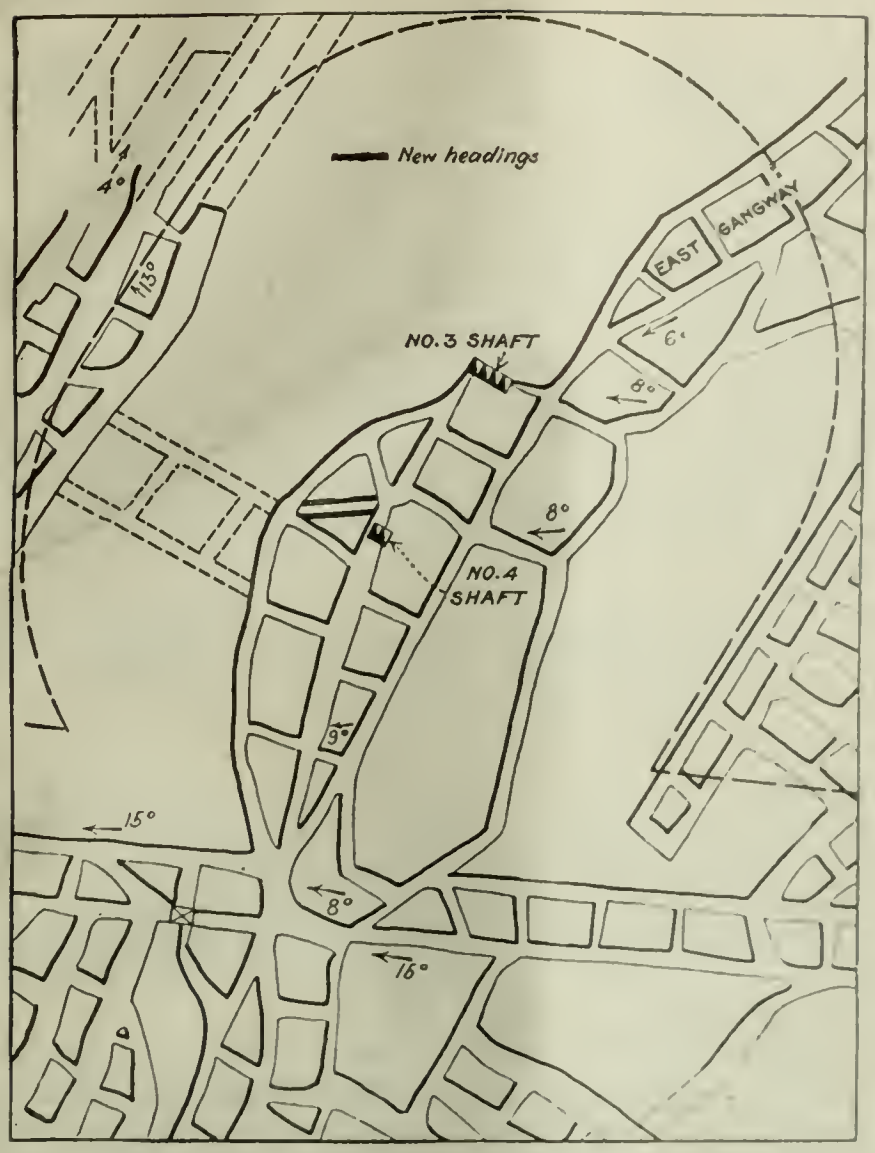


Moreover, the method of operation had elements of danger that could have been avoided. The empty cars had to be pulled backward across the cage in order to take them to the loading faces. This was a danger-

ous practice, as a mistake might occur that would let a car or a locomotive fall down the shaft. Furthermore, the cage had to be held to permit the backward and forward passage of the trip, and that in itself was a cause of much delay.

To avoid excessive cost and unnecessary hazard the layout had to be changed. It was found that one hoisting engine was capable of raising all the coal produced in the mine. It was decided therefore to hoist all the coal from one shaft and to use the other for raising and lowering men and for the delivery of supplies. This obviated much of the confusion due to using each cage for two purposes. It enabled the men at the coal-hoisting shaft to attend strictly to that business, obviating many delays resulting from the loading and unloading of the cage.

In laying out the new shaft stations great care was taken to reduce operating costs to a minimum and to avoid delays. Not only was the new shaft station carefully planned but the old ones were entirely remodeled so that they could be more economically operated.



All the coal from the Bennett and the Red Ash beds was formerly hoisted up No. 3 shaft, No. 4 shaft receiving the coal from the Abbott, Kidney, Hillman and

REMODELING OF THE LANDING AT KIDNEY BED

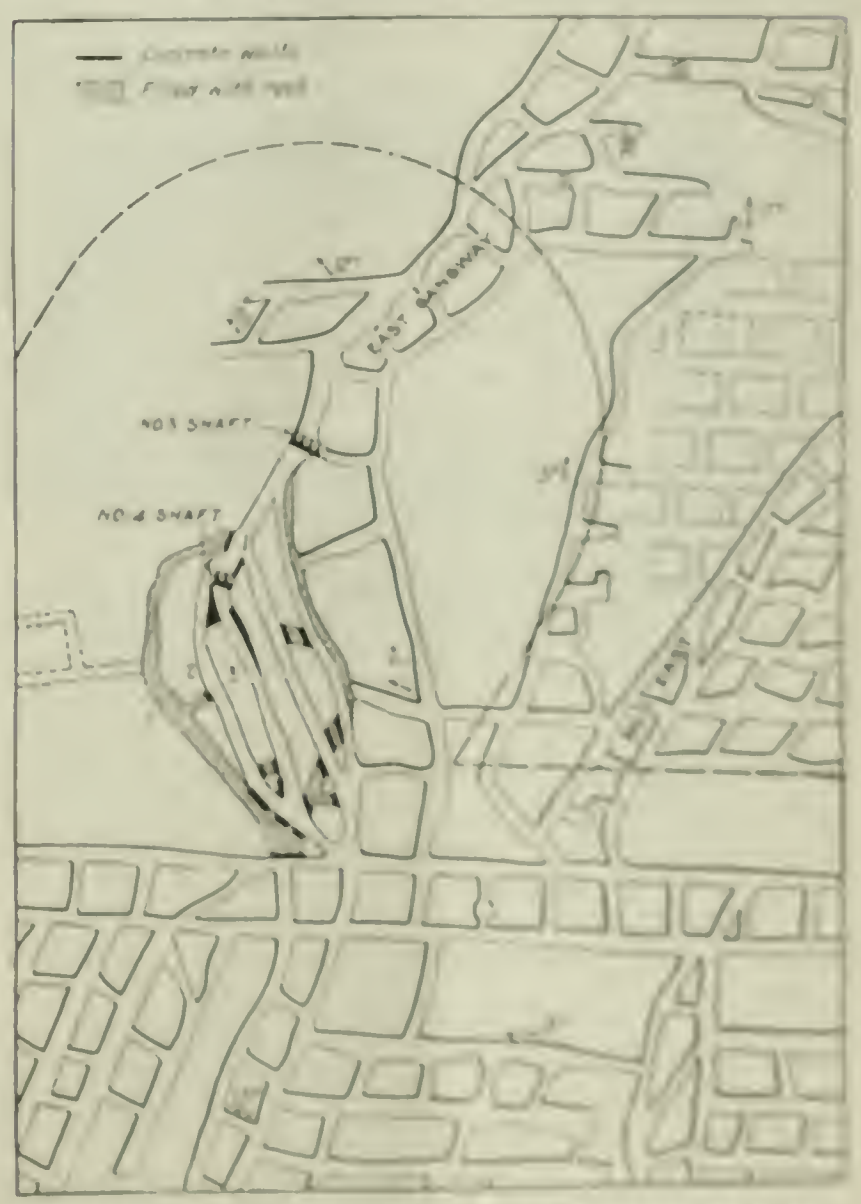
The Kidney bed is 330 ft. below the surface. By driving a crosscut the return track was shortened, making the grades steeper. Elsewhere, the grades were eased by blowing rock. The rearrangement made the use of a mule unnecessary, as the cars ran on the rope automatically without either hauling or pushing

Cooper beds. The Bennett and Cooper beds being close together it was found possible to abandon the shaft station in the Bennett bed and build a new haulage road from that bed to the shaft station on the Cooper bed. This left only the Red Ash with a station on No. 3 shaft, and a new station for the coal from that bed was built at shaft No. 4, No. 3 being converted into a man-and-material shaft.

HILLMAN STATION SUPPLIED BY LOCOMOTIVE

This station required a change similar to that made in the Kidney bed. The cars run back to the empty pit in the heading on the left from a kickback near No. 1 shaft.

The changes made it possible to dispense with four of the men originally employed underground, two foot tenders, one runner and one shaftman. In addition, it was possible to dispense with one substation man. On the surface one cager replaced the two formerly employed, and one of the five hoisting engineers was dispensed with. In all, the force was reduced by seven men. This saving totaled approximately $12,000 a year, which would pay interest on $200,000 when figured at 6 per cent.



Locomotive Crossed Cage to Reach Empties

The changes at the various shaft stations will be detailed one by one starting from the surface downward, the first station being in the Abbott bed. Here, as the coal was being hoisted already from the No. 4 shaft and was to continue to use the same shaft as its means of exit, no new station had to be built but important changes were made nevertheless. At this station the locomotive had to cross the cage to reach the empty mine cars. After being coupled up it pulled the cars back across the cage. To avoid the necessity for this a new passage for men and materials was constructed around the end of the shaft.

Part of the old runaround on the other side of the shaft was abandoned and that part which was no longer needed was tightly filled with rock so as to give additional support to the shaft. A roadway was driven from a point on the side of the shaft nearest to No. 3 to connect with the empty-car track. In order to improve the grade, rock was lifted in this latter track. The empty cars are now kicked off the cage by the loaded cars. They run a short distance to a kick-back which causes them to travel to the empty track by the passageway described. Thus it is not necessary for the locomotive as in the past to cross the cage to gather its trip of empty cars.

The shaft station of the Kidney bed did not need relocation and only a rearrangement of tracks was necessary. The loaded cars are delivered to this shaft by means of a rope. The original grade at this shaft was not sufficient to make the cars drop by gravity from the end of the rope to the shaft, so a mule had to be kept at this point to move them. By taking down 3 ft. of roof the grade was increased sufficiently to enable the cars to run by gravity. With the old arrangement the empty track also had an insufficient fall, and the cars would not run by gravity to the rope. Consequently they had to be helped along the road by man power. A new road was cut, obviating this difficulty. It shortened the distance and so increased the gradient. By means of these changes a mule was dispensed with and much hand labor avoided.

The Hillman station was similar to the Kidney station except that the mine cars were delivered by a locomotive instead of a rope. Consequently, the grade of the loaded tracks needed no change, but the empty tracks had to be reconstructed so that the empty cars would run far enough from the shaft to give storage room. To get this grade a short cut was driven to the "slum," or empty pit. This shortening of the distance increased the grade considerably.

RED ASH LANDING 1,080 FT. BELOW SURFACE

This is the deepest of all the workings at this time. It lies over old N. Bolan sea level. Two workings are shown over the approach on the left of the shaft, one the new empty track and the other a pump chamber. This heading to No. 4 shaft had to be constructed in its entirety because the coal formerly was hoisted at No. 3 shaft and only the cage connected to No. 4.

In some other parts of the field the Cooper and Bennett beds are one. They unite to form the Baltimore bed. But on this property they are separated by a parting of rock. As stated already, arrangements were made by which the coal from both beds should come to the Cooper bed and be hoisted up shaft No. 4. In the old Cooper station no runaround had been provided, so it was necessary to bring the empty mine cars back across the cage. This was dangerous and caused much delay. In the illustration showing the work in this bed concrete is shown in solid black, old gangways in ordinary black lines, abandoned headings stippled and narrowed headings with the part abandoned in stipple.

The station at shaft No. 3 was left in place so that it could be used in an emergency. All the changes that were made were at No. 4 shaft. When it was decided to make the improvements a gangway marked *1* in the plan was driven to accommodate the empty-car track, but this roadway did not have a suitable grade for that purpose, and as it was thought that it would too greatly weaken the shaft pillar if left open, it was filled with rock to the roof. A new heading, *2*, just to the right of the shaft station was then driven to accommodate the empty tracks. Sufficient bottom was taken up to provide the proper grade for the empty mine cars. With the new arrangement the empty cars, after they are kicked off the cage, run toward No. 3 shaft for a short distance till they reach a kick-back. They then run downgrade on the empty track. All the unused portions of headings were filled to the roof with rock. The ends of the headings and of the cross-cuts thus filled were closed off with concrete walls.

Wherever the shaft station was too wide, concrete walls were placed, thus bringing them back to their proper width. These walls are shown in the map in heavy black. As it was thought that the heading used for the loaded track leading to the old shaft station was too wide, it was narrowed by building stone walls up the side of the roadway. In consequence the roof around the shaft is now satisfactorily supported.

At the Red Ash bed an entirely new shaft station had to be provided because the coal was formerly hoisted through shaft No. 3 as originally constructed, No. 4 shaft, which came down to this level, being used solely for the hoisting and lowering of men and lowering of materials. This new station is provided with a double track and the method of handling cars is similar to that in the Hillman bed. The new work is shown in heavy black lines in the illustration. Formerly the empty cars had to be hauled across the cage as was done in other of the stations in this mine.

Electric Bell Trapper for Partings

By Cecil Rowe*
Tokay, N. M.

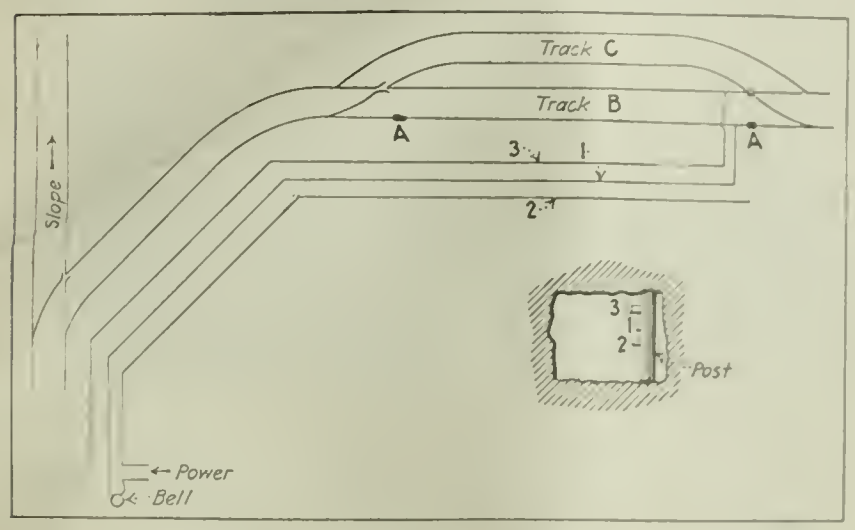
FOR several years at the B. H. Kinney Coal Mine a boy was employed as trapper and to notify the rope runner in the main slope if a trip was standing in the parting of one of the headings to the right into which he desired to place cars. From the point where the trip branched off the main slope to the end of the parting was somewhat more than 500 ft.

Being around a curve, the rope runner when in the slope was unable to tell whether the parting held a loaded trip or was empty. Consequently a trapper had to be provided to notify the rope runner when the cars should be run in. A simple and inexpensive change was made in the wiring already installed. This modification cut out the cost of a boy trapper and used only a few cents' worth of electricity each day.

Before the change was made two wires, both of No. 10 galvanized iron wire (*1* and *2* in the illustration), were provided for a bell-ringing circuit. The power used was 20 volts alternating current. This voltage was obtained by connecting in the 220-volt circuit transformers such as are adapted for the ringing of small bells. In making the change one extra galvanized wire, *3*, like those numbered *1* and *2*, was strung along the heading parallel to the other two.

The only other change necessary was to cut out two small parts of the rail on track *B* and replace the portions removed with insulating material, *AA*. Fiber or rubber could be used for that purpose, but a block of hardwood will serve the purpose admirably.

It also was found convenient to place wires *2* and *3* on longer insulators than wire *1* so that the rope runner would not mistake their identity when making contacts to ascertain whether a trip was standing on the parting.



Where there is a trip on the loaded track, *B*, wire *3* automatically is made part of an open circuit with wire *1*, the connection being through the wheels and axles of the cars. When there is no trip in the parting on track *B* there is no connection between wires *1* and *3*, as the rail between the insulated portions *AA* cannot complete its circuit.

When the rope runner has a loaded trip ready to drop into the parting he places his bell ringer across wires *3* and *2* and if the bell rings this notifies him that there is a trip in the parting and that he must wait. After trying at intervals he finds at last a time

*Mining engineer, B. H. Kinney Coal Mine.

when the bell does not ring by connecting these two wires. Then he bells the engineer the regular signals by using the original bell wires, *1* and *2*.

It may be asked what would be the result if the electricity failed or were turned off. In that event, of course, the bell would not ring, although a loaded trip might be in the parting. Provision has been made for

MEANS FOR FINDING IF SIDE TRACK IS FULL

This generalized drawing shows how when cars are on Track B a circuit can be established between wires 3 and 1 through the axles of the cars providing the wires are connected by the rope rider.

this by placing an electric lamp in the power circuit near the switch that leads from the slope to the parting. The rope runner then can tell at a glance whether the current is on or off.

This lamp serves a two-fold purpose. It notifies the rope runner when the wires are charged and it furnishes him with ample light for the manipulation of the switch. Track *C* is used for handling empty cars. The plan just described has been in use for several years and has not given any trouble.

Lifting Bottom in Mine Openings Without Disturbing Timber Sets

By Alphonse F. Brosky*
Pittsburgh, Pa.

How often in the driving of an opening for haulage from the outcrop does it become necessary to change the grade after the entry has penetrated some distance from the outside? It is a problem that crops up almost daily at some one mine or another. The coal may persistently follow a regular grade under the body of the hill, but near the crop it may rise or fall for a short distance without any regard to the regular lie of the measure.

In the event that the entry goes to the dip so as to fall from one to three feet in one hundred for a moderate distance and goes level from there on, it is customary to take bottom in the haulageway from the mine portal in so as to eliminate the adverse grade. This is done before a permanent track is laid. But when the entry was driven it may have been necessary to timber and lag it as it progressed inward. This support may be continued for a considerable distance if the cover is light or of a drummy nature. Should the bottom be hard, much explosive may have to be used in lifting the bottom and unless care is taken timbers may be shot out, bringing down the roof and causing much necessary mucking and retimbering.

J. L. Evans, the mine foreman [illegible] mine No. 304 of the Consolidation Coal Co., at Jenkins, Ky., has an interesting way of accomplishing this task with minimum expense and labor. He had a condition similar to that already described in the No. 302 mine of the Elkhorn Coal Corporation at Mater, Ky. An opening was started, which later was to become the main haulage road. A prospect hole some 2,000 ft. from the pit mouth indicated that the coal dipped into [illegible]. When the opening had penetrated 180 ft., however, it was discovered that the elevation of the coal at that point was 3 ft. below its level at the outcrop, and then it became level for 1,000 ft., where it dipped again. As driving and timbering were carried on simultaneously and as the bottom was sandstone, the work of taking up bottom was precarious. A 1-per cent grade in favor of the loads was made by lifting 5 ft. of bottom at the pit mouth and a decreasing thickness toward the end of the dip. The work was done without disturbing a single timber. When the job was completed the legs of the batter legs of the timber sets rested on a ledge, the upper face of which had originally been part of the bottom.

The entry was 14 ft. wide. Timber sets of [illegible]-in. oak stood on 3-ft. centers. These were [illegible] and lagged as indicated in the sketches shown in the illustration. The arrangement of the shotholes for the blasting of the bottom also is indicated. The first round of holes was drilled in line with the timber set at an angle of 45 deg. These were the breakout holes.

GRADE ADJUSTED WITHOUT DISTURBING TIMBERS

[illegible] drilling and shooting the bottom, using [illegible] as fulcrum on the center of the roadway which is [illegible] by further drilling and shooting. The holes were drilled horizontally.

The second and third rounds of holes were drilled horizontally as shown.

The total cost of the job was approximately $400. This sum would not even pay for retimbering such a roadway. To lift the bottom, holes were drilled of 1¼ in. diameter and charged with a 60-per cent dynamite for the first round and with a 15-per cent dynamite for the second and third rounds. With a crew of three men the job was completed in 60 days.

*Bituminous Field Editor, *Coal Age*.

Sinking a Shaft in Illinois Through Quicksand*

Expecting Only Four Feet of Running Sand and Finding Nearly Thirty Feet, Shaft Had to Be Enlarged and Sheet Piling Driven to Bedrock When Jacking Method Failed

By D. P. Buchanan

How unreliable the diamond core drill may be in prospecting in any formation except solid rock is evidenced by the experience in sinking the shaft of Mine No. 15 of the Old Ben Coal Corporation, at West Frankfort, Ill. The log of the hole, drilled to ascertain the conditions at this shaft, shows only 4 ft. of sand, whereas in reality 25 to 29 ft. was encountered before the rock was reached. No trouble had been experienced in sinking the near-by airshaft, and it was thought that this shaft also could be sunk without difficulty. It is the common practice to rely on a single boring, and with the experience in the airshaft as a guide it was not thought necessary to make an exception in this instance.

The log of the surface measures ran as follows:

From, Ft.	To, Ft.	Thickness of Strata, Ft.
0	4	4
4	50	46
50	63	13
63	93	30
93	97	4

Relying on this log, construction was commenced with the timbering at the exact size planned for the finished shaft, allowance being made, of course, for the concrete lining but not for any divergence of the shaft from the true line.

Until a shaft reaches bedrock the curbing or lining must be supported from the surface. After hard rock is reached the timbers are securely anchored, but during the excavation their weight is borne by a rectangular set of logs known as the bearing timbers or shaft template. These are eight logs from 10 to 30 in. in diameter. Two of them are buried in the ground parallel to each other. The other two are laid cross-wise and are securely fastened to the first pair by drift pins.

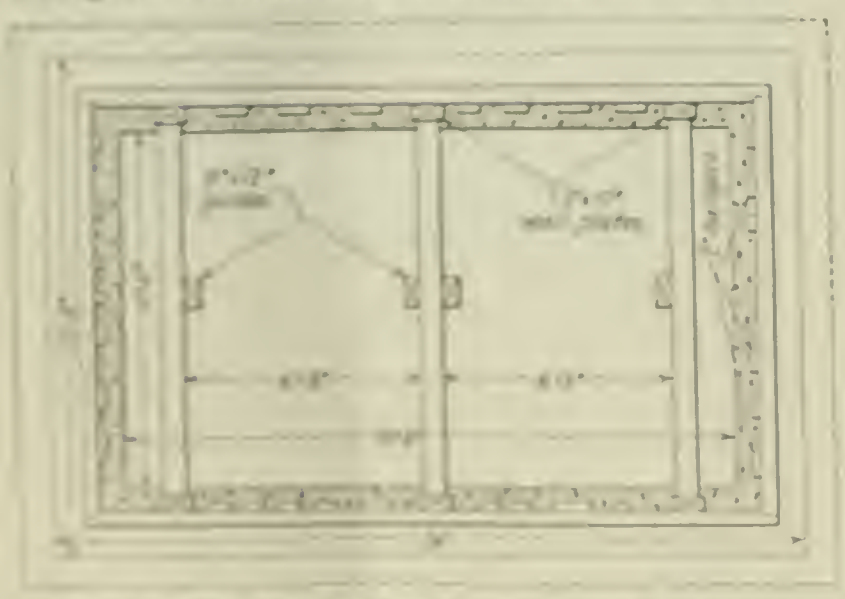


FIG. 1—PLAN OF SHAFT AS ORIGINALLY PLANNED

To insure a strong support the ends of the logs must project 10 ft. to 15 ft. beyond the shaft opening. The inner surfaces of the timbers are adzed to align them with the shaft curbing, which is attached to them by cables. Plumb bobs are suspended from the corners of the template to insure a perpendicular excavation. The first 3 ft. of sandy loam and also the 17-ft. band of sand clay underneath it were excavated by long-handled shovels without the use of explosives.

While this ground was being excavated the temporary headframe for the sinking of the shaft was under construction. This frame was of steel. It was equipped with only one sheave, which was set in such a way that it could be shifted to either of the two main compartments of the shaft. The wooden trestle and hopper into which the excavated material was dumped was about 16 ft. above ground level.

The headframe was so constructed that there was headroom enough below the sheaves only to clear the clamps above the bucket when the latter was hoisted to the elevation of the trestle. The buckets used were made of boiler steel and were approximately 2½ ft. in diameter by 3½ ft. deep with a capacity of about 17 cu.ft. When the hard yellow clay was reached hand digging became more difficult, and an occasional "buster" shot of dynamite was fired to loosen the ground. The excavation was carried on in this manner to a depth of 63 ft. through soil so devoid of water that a pump was unnecessary. When the construction of No. 15 was commenced the excavation was made large enough to permit of a cross-section of 11½x19½ ft.

FIG. 2—SHOWS HOW QUARTER SHAFT WAS RESTORED

Below the sands and clays the quarter shaft was quite readily dug back into the walls and it was constructed accordingly so as to permit the air the more readily to pass the moving equipment in the shaft. Note the water ring at the bottom of the drawing, which in the shaft lies 200 ft. below the surface.

*Excerpted from the proceedings [illegible]

FIG. 2—MUCKING SHAFT FLOOR FOR FURTHER ADVANCE

Crew is getting shaft in shape for the next shift to sink blasting holes and shoot up a further round of shots. The shaft at this point is below the quicksand.

after the curbing was in place. The latter was of 6x10-in. yellow pine (Fig. 1). These are, of course, the full dimensions. Timbers do not as a rule measure as much as the dimensions indicate, however, for practically ¼ in. is planed off in dressing them. Allowance must be made in shaft construction for this odd size, because the permanent hoisting cages usually are purchased before the guides are placed, and a deviation, however slight, therefore is serious.

At a depth of 63 ft. quicksand was encountered. Inasmuch as the log had shown only 4 ft. of sand no great difficulty was anticipated, but, as has been mentioned above, herein lay the fallacy of the log, for the sand lasted until the rock was reached, at 90 ft. A strongly reinforced wooden shoe with a 6x6x½-in. angle was constructed on the surface, knocked down, and reassembled at the shaft bottom.

Jacking Process Which Usually Succeeds

On top of the shoe the four sides were built up with 2x3-in. timbers laid flatwise, and ordinary house-raising jacks of various sizes from 10 to 18 in. in length and 3 in. in diameter were then set around the perimeter of the shaft on top of this timbering at about 4-ft. centers. This is a common method of sinking through shallow strata of sand, and although it is a slow process it is very effective in sand not thicker than 5 ft. The method consists of jacking down the shoe, the jacks operating against the shaft curbing, and as the space between is widened it is filled with more 2-in. plank nailed flatwise. As the jacking progresses the material is excavated by hand and hoisted.

It was necessary to pump continuously, as water was coming up through the sand and pouring in from the sides of the curbing. Two sinking pumps were kept in operation and even when no work was being done in the shaft large quantities of sand were brought up in the water. Naturally, the removal of this material from about the curbing caused the surface to cave in, bringing the weight of the material around the curbing against the timbers.

The buntons, which had not been designed for this unequal pressure, buckled and in many cases broke. It was necessary to install new timbers until the shaft was so obstructed that the work was continued only with great difficulty. This, together with the crookedness of the shaft caused by the bulging, necessitated a change in the method of sinking, as it was useless to go farther with the scheme then being used.

The decision to drive through the sand with United States steel sheet-piling was the result. Obstructed as it was with excess timbers the shaft did not present enough clearance for a pile-driver or steam hammer. It was necessary, therefore, to begin again at the surface and widen the shaft down to the sand. The old timbering was removed as the work progressed and the shaft was sufficiently enlarged to accommodate the hammer.

Even then there was scarcely enough clearance for it, and contrary to the usual procedure of setting all the piles in place before driving any one pile to the rock, each pile was so driven before setting the one next to it. It was necessary to calk the cracks to keep out the quicksand. The pressure was so great that the water was forced beneath the piles and rose in the shaft, making it necessary to keep the pumps working. Elaborate timber sets were placed at 4-ft. vertical intervals to hold the piling in place as the excavation continued through the depth of the sand. The material inside the piling was removed and the shale was picked from beneath it by hand, after which it was driven below the solid measures to a depth of 4 ft.

Shafts Must Be Concreted from Rock Up

The Illinois mining laws require that all shafts be concreted from the rock to the surface. This work was immediately commenced, therefore, as soon as the rock was reached. A 2-ft. kerf or undercut was made, and the anchor block was completed before the upper curbing was poured in. The curbing was then poured in 4-ft. sections, working from the bottom up. For obvious economical reasons old scrap steel, mainly 30- to 40-lb. rail, was used for reinforcement. This material was employed in exactly the same manner as is customary with regular twisted reinforcing rods. A rectangular system of bracing was used, the rails being laid horizontally and vertically on about 2-in. centers. The vertical rails were allowed to project from one ring of concrete about 4 ft. into the next above it.

When concreting was begun it was found that a longitudinal section of the shaft was irregular, and in order to insure a sufficient thickness to the curbing on

that it could withstand the pressure the shaft had to be shortened, one quarter-shaft being dispensed with (Fig. 2). As soon as the excavating was continued in the mill structure it was again lengthened so that the quarter-shaft could be reconstructed. The last time and extra expense resulting from this lengthening were justified by the increased return airway and more rapid hoisting which it provided.

EXPLOSIVES USED SPARINGLY NEAR QUICKSAND

In order not to disturb the rock immediately beneath the quicksand no explosives were used until the work had progressed by hand picking and drilling to a depth of some 10 to 12 ft. below the sand. This care was necessary to avoid shattering the rock and flooding the shaft. As this point machine drilling and blasting were first employed, the wedge or center-sumping cut being used. In this cut a central wedge is first blasted out, leaving free working faces for the remaining side shots. The drills used during this phase of the work were "jackhammers" or hand-held rotative hammer drills. Straight dynamite of 40 per cent strength was the only explosive used. The sinking was completed to this method, the total depth to the bottom of the sump being 465 ft.

A water ring (Fig. 2) was cut out of the rock at a point about 200 ft. deep to drain the seepage. Wire netting was hung from the curbing by long staples, and the entire shaft, beginning from the bottom, was coated with "gunite" by a cement gun suspended on a temporary stage. "Gunite" is impervious to moisture, so the only water collected by the ring comes from the surface or is moisture that condenses on the cool concrete during the summer months.

With this lining completed, the actual sinking was accomplished. All that then remained to be done was the placing of the guides (Fig. 1), which were installed while the permanent headframe was under construction. Because of the deceptive prospect log and the excessive amount of quicksand encountered, the entire project required nearly a year for completion.

Six Coal Articles Presented at Vancouver

OF THE three days during which the Canadian Institute of Mining and Metallurgy held its annual meeting in Vancouver, B. C., Nov. 15 to 17, only one day, Nov. 17, was devoted to coal mining. On the morning of that day four coal papers were presented: "The Complete Gasification of Coal and Its Bearing on the National Fuel Problem," by John Keillor, Vancouver, B. C.; "The Development of the Coal Industry in Canada," by F. W. Gray, Montreal; "The Coal Resources of Southern Vancouver Island," by J. D. MacKenzie, Vancouver, B. C., and "Progressive Coal Mining," by George A. McHattie, Vancouver, B. C.

Many of the delegates took advantage of the opportunity afforded them to visit the coal mines of Vancouver Island in the afternoon, an excursion having been arranged for the two-hour steamer run across the gulf. In Nanaimo the party was taken through No. 1 mine of the Canadian Western Fuel Corporation, and in the evening a second business session took place. At this, a paper was presented by J. A. Richards, district inspector of mines, Edmonton, Alta., on the "Coal Mining Industry of Alberta." It was followed by a paper entitled "Some Interesting Features of Modern Coal Mines," by R. R. Wilson, of Victoria, B. C.

Thomas Graham, superintendent of the Canadian Collieries (Dunsmuir's), Ltd., referred in congratulatory terms to Mr. Richards' address. He had listened with great interest to his account of the progress the industry was making in the Province of Alberta. Within the next twenty-five years, he predicted, this province would be the largest coal producer in the British Empire.

Recognition of the certificates granted to mine officials in one province should be recognized, it was urged, in all the other provinces of Canada. It was argued that if such an agreement could be reached Canadian certificates would carry more weight outside the Dominion than they do at present. A committee was appointed to fully investigate and report on the matter.

Alaska Slowly Develops Commercial Coal Mines

Alaska's coal is distributed on the Pacific slope of the coal measures, a belt which extends from the Arctic Ocean to the Alaska Peninsula and includes Bering River, Matanuska, Nenana, Kenai, Cook Inlet, Kachemak Bay, Herendeen Bay, Chignik, Unga Island, Kukak Bay, Kodiak Island, Alaska Peninsula and the Aleutian Islands. The Bering River coal field, which is the largest of the coal fields, is being developed by the Bering River Coal Co., a subsidiary of the Morgan-Guggenheim Alaska Syndicate. The Matanuska field is the nearest of the Alaska fields to the mines of the Tanana Valley Coal Corporation. The development of this mine on the upper reaches of the railroad promises to have an important bearing on the whole economic situation in the Fairbanks region. The accompanying photographs give an idea of the formation and show the newly laid track facilities as well as the provisions which have been made for handling the output of the property. These illustrations show the status of the mines as of June 1 of this year.

Means Provided to Prevent Abuse of Power in The Federal Coal Council of Germany*

Three Barriers Serve to Promote "Interest" of Community as a Whole"—Conditions of Delivery and Commercial Credits Regulated—Mines Empowered to Appeal from Syndicate and Association Decisions—Teaching Heat Economy

By F. Z. Nedden, M. E.

THOUGH the operators are in a minority as compared with consumers in the Federal Coal Council of Germany, the interest of the miners' representatives in questions affecting development of production is obvious. Furthermore, all coal and lignite mines are combined in the National Coal Association and their representatives usually constitute a unified vote. The consumers' representatives, on the other hand, do not hang together so solidly. The weight thus given to the owners should not be overestimated.

Three main barriers have been erected against their overstepping the limits of control by the community. First, the federal Secretary of Economics and Production has the right to participate or be represented in all meetings of the council or its committees, and to veto "all decisions dangerous to the common welfare." He has made use of this right on various occasions, especially by curbing as far as possible the upward trend of coal prices.

It has proved possible, by bringing to bear constitutional influences in the Reichstag, to prevent the abuse of this right by the Secretary of Economics and Production—yet, in order to keep his right of veto from becoming a weapon for bureaucracy, instead of a shield for the interests of the nation, the originators of the Coal Act, if redrawing it today, might perhaps prefer to accord the council the right of appeal to the Reichstag against this veto.

Give Publicity to Parliament Sessions

The second barrier consists in giving publicity to all full sessions of this coal parliament.

A third protection for the interests of the consumers and the community is provided by the institution of three standing "committees of experts," one dealing with technical, another with social questions connected with mining coal and lignite, and the third with all questions relating to the rational consumption of fuel. Each of these three committees is composed one-half of members of the council and their proxies, and the other half of co-optated specialists, such as experts regarding coke ovens, briquetting plants, shaft sinking, furnaces, gas generators, low-temperature tar etc Thus, if the consumers' or workmen's representatives in the council require expert advice on any question relating to coal or lignite or their derivatives they can at any time recur to the clause in the Coal Act which provides that "the committees of experts have to prepare for final decision all matters which the council may assign to them." Any statement made by any part of the council may under this clause be closely scrutinized by the best neutral experts, and no monopoly of superior economical or technical insight or experience can be claimed by the coal producers.

This self-administrative organization of the German coal trade has proved very effective in serving the purposes for which it was created, namely "to conduct under the general supervision of the federal government the coal trade, including importation and exportation of fuel, according to the interests of the community as a whole."

It should be emphasized again that the Federal Coal Council is supreme in its decisions as far as the coal trade is concerned and that it has legislative powers over it. The only difference as compared with a political parliament consists in its relation to the federal government: while this is responsible to the Reichstag, the Secretary of Economics and Production is not responsible to the Federal Coal Council. Obviously such responsibility would not be possible under any circumstances as otherwise the sovereignty of the people as represented by the Reichstag would be limited by the sovereignty of one fraction of it: the Coal Trade.

National Association Is Executive Medium

The National Coal Association acts as the supreme executive organ of the Federal Coal Council. It carries out in detail the laws of the council, just as a department of the central government acts on the general rules of the Cabinet. In this capacity the National Coal Association keeps the statistical records of the coal trade, analyzes the costs of production within the various branches of coal and lignite mining, fixes the relation between prices according to qualities and special conditions in the various districts, etc. Prices, however, are fixed and become effective only through the co-operation of both the association and the council or its executive committee and are subject to the veto of the federal Secretary of Economics and Production.

The syndicates are actually carrying on the business. Through their trade organization or business connections they sell the fuel produced by their mines. They decide what percentage and what kind of fuel their members may put aside for their own consumption, they uniformly regulate conditions of delivery, of commercial credits, etc., in much the same way as the central office of a large concern takes care of the common interests of all its affiliated works. There is, however, one fundamental difference. Inasmuch as the mines were compelled under the Coal Trade Act to join their respective syndicates and as the syndicates do not hold any part of their shares, they must be protected against undue or arbitrary measures of the syndicate. It is possible, therefore, for each individual mine to appeal against the syndicate to the association, and from the decision of the association to that of the Federal Coal Council. The mode of procedure for these cases forms a particularly well considered part of the Coal Trade Act. During the first three years of its enforcement, however, very few cases of appeal have actually arisen.

*Concluding instalment of Herr Nedden's article on German coal control. The first part appeared in *Coal Age* last week.

Under the Coal Trade Act the syndicate agreement is subject to the approval of the Federal Coal Council. When the matter came before its forum serious misgivings were entertained by the most diverse parties lest this reformation of the privilege of own consumption might gravely endanger all the rest of the non-privileged collieries and consumers. It was feared that not only would a great quantity of coal thus be reserved to a privileged small group of giant combines but that these owing to their immediate influence on the collieries also would obtain the best qualities of fuel. The remainder, it was feared, would suffice neither in quantity nor in quality for all the other and smaller consumers, the market would be narrowed down, high grade coal be practically unobtainable, and the base of competition shifted still more to the advantage of the large concerns. The non-privileged collieries, too, entertained apprehensions lest under the new contract any fluctuation of the market would react heaviest upon them while the privileged collieries always would fall back on the stabilizing base-load of the requirements of their affiliated works or big contracts.

Regulation Redrawn in Orthodox Form

The Federal Coal Council, therefore, decided against the approval of this paragraph, which had to be reshaped very much in the traditional form, so that again a danger to the industrial development of the country and to the coal trade as a whole was averted by the Federal Coal Council.

While these two examples serve to show the protective powers of the council, a great deal of excellent productive work has been performed by it. For instance, through one of its three standing committees of experts a campaign has been begun for the improvement of heat economy, both in industry and in domestic use.

Further, by the co-operation of two of these standing committees with the council in full session, considerable has been accomplished in improving the quality of coal. In May, 1921, the scarcity of high-grade screened coal had become embarrassing. On probing, the experts found that the relation between the prices of screened and unscreened coal had, in the process of re-adapting them to the shifting levels of money value, gradually become so small as to make screening unprofitable for many collieries. It was then ascertained, by careful analysis of the relative over-all efficiency produced by screened and unscreened coal under boilers, in furnaces, etc., that the industry might well pay a slightly higher price for screened coal and yet buy the thermal unit as cheap in the shape of screened coal as in unscreened. By introducing this relation into the schedule of prices and slightly enlarging the margin between screened and unscreened coal screening became profitable again, and the output of screened coal increased 16 per cent within the next three months.

One remark only should be offered in conclusion, and this in connection with the most important business of the Federal Coal Council, namely the fixing of prices. Inasmuch as this is done in common session of producers, consumers and workmen employed both in the mines and in other industries, the economic insight of all participants is extraordinarily developed and their vista enlarged from the individual field of each trade to that of the common interest of all. Mutual understanding is promoted and oppositions are alleviated which political strife is apt to enhance.

Coal Mining Institute of America's Biggest Session—II*

Need for More Technical Training—Economical Way to Humidify Air—Will Overdevelopment Be Eventually Corrected and How?—Sawn Versus Hewn Mine Ties—Pressed or Welded Bonds

SIGNIFICANT among the declarations at the meeting of the Coal Mining Institute of America was that of Dr. Yandell Henderson to the effect that with the aid of a mixture of carbon dioxide and oxygen it was possible to bring back to normal condition victims of carbon-monoxide poisoning in 15 to 30 minutes. The patients find themselves inhaling so energetically from the mask that they try to free themselves from it and can be restrained only with difficulty. From a condition of suspended breathing they are in a short time brought into a state in which they breathe so energetically that the exertion is displeasing to them.

The lecturer declared that by compelling the lungs to breathe in more air than is required the air expired becomes so extremely low in its percentage of carbon dioxide that all voluntary breathing ceases. When the will is no longer used to cause the lungs to operate they will cease entirely to function for a few seconds because the animal is stimulated to breathe solely by carbon dioxide irritating the centers of respiration. The condition of suspended breathing is known as apnoea. Some people, however, are not subject to any such total suspension of respiratory activity, being sensitive to such low percentages of dioxide that no depth of respiration or continuance of the effort will so reduce the percentage as to make its action on the respiration centers ineffective.

Victims Recover Without Having Pneumonia

One of the great dangers of asphyxiation is the pneumonia that is likely to follow. One out of every three or five have that disease, sometimes as many as 50 per cent. With the administration of a mixture of oxygen with carbon dioxide, not a case of pneumonia resulted. The new inhalator invented by Dr. Henderson is being made by the Mine Safety Appliances Co., the royalties received going to a fund for the further investigation of resuscitatory methods for asphyxiation.

Mr. Greensfelder asked whether the inhalator would be useful in reviving those overcome by nitrous fumes from explosives. Dr. Henderson said that he believed it would be of value in all kinds of asphyxiation, even from war gases. In reply to Mr. Affelder he said it might be available in all pneumonia cases regardless of the source. Answering Mr. Cooper he declared that it would be useful in cases of ammonia poisoning such as might occur in connection with ice plants at company stores but that it would be unnecessary where the patient was already breathing, as elimination was rapid.

Mr. Maize recalled a case in the Connellsville region where a stable boss complained of severe headache. Several days later a man was found laid out as in a fit in the return airway. He was found to be bleeding. Inspection showed carbon monoxide in his blood. Some time after the discovery of this man gob stink was smelled in the return airways and it was found that the mine was on fire. The fire must have been of long standing but the evidence was wholly in its physiological effects on the men exposed to its influence. There have been seven cases lately in the Connellsville region of such spontaneous gob fires.

Dr. Henderson said the hemorrhage such as this man developed was quite usual in asphyxiation and also that carbon monoxide usually escaped from the blood completely 6 or 8 hours after it has been inhaled. Dr. Henderson added that he had absorbed carbon monoxide till his blood was nearly 50 per cent saturated and Dr. Haggert till over 50 per cent of the blood capacity was absorbed. Dogs had received up to 80 per cent of saturation and been revived. In fact the degree of saturation might be further extended without death provided oxygen and carbon dioxide in the proportion of 19 to 1 was provided and that the work was done before degeneration of the brain set in. Resuscitation must be done early, however.

College Education Will Be Indispensable

A well-attended banquet at McCreery's Store concluded the sessions of Wednesday. President Rush N. Hosler presided. Jack Armour, humorist from *Coal Age*, made the opening speech, and was followed by Dr. E. A. Holbrook, dean of the School of Mines, Pennsylvania State University, on technical education for mining men. Dr. Holbrook was distinguished by his usual modesty. However, it is to be regretted that the college officials are so modest and such diffident salesmen of the educational idea, for that is one of the reasons why the advantages of education are being only meagerly sought.

How mining men without technical training and stationed where they are largely dependent on their own resources can hope to cope with the problems of the modern electrified mine is difficult to understand. It is safe to say that if men of technical training had been given the proper consideration in the operating depart-

*First part of this article appeared in *Coal Age*, Dec. 21, pp. 997-999.

AN EXPERIMENTAL COAL EXPLOSION IN A GRASS FIELD

mines of coal mined the coal industry would today be as scientifically and as economically administered as the metal mines.

Mr. Holbrook stated that in Great Britain coal mining was taught in seventeen higher-class institutions and in forty-four schools of a secondary rating. He declared that in Pennsylvania there were only three institutions giving a full mining course, yet the output of Pennsylvania was roughly the same as that of Great Britain. He added that using the law in favor of the taxation of anthracite had been approved by the Supreme Court it would seem only natural that the state should tax the coal industry to complete the education of those who had to supervise the work of mining throughout the state.

Dr. Holbrook was followed by Douglas Malloch, of Chicago, Ill., who spoke on "Sinners I Have Met," numbering among them the quitter, the pessimist and the grouch. Mr. Malloch is a past master in epigram and kept his audience convulsed with laughter.

Use Natural Heat of Abandoned Workings

At the Thursday morning session, over which Jesse K. Johnston presided, J. W. Paul replied to the question "What is the most efficient method for humidifying mine air?" He stated that the humidification did not in any way reduce the force of an explosion. The air might be 100 per cent humid and yet the explosion would extend with unrestrained violence. Humidification of air was to be recommended only when the air thus saturated was at a higher temperature than the mine and consequently could be relied upon to deposit moisture in the workings. Even then it was of value only if it has been passed through the mine so continuously as to prevent the natural moisture from being evaporated or be add to that moisture.

Commercially in cold weather the air must be heated. That could be done by putting steam into it or by passing it over radiators. A less expensive way was to pass it through abandoned workings, which would raise its temperature to the natural heat of the ground. If steam were then added the humidification would be effected at a low cost. Mr. Paul said that 50 per cent of water would make coal dust safe against ignition but it would require 30 per cent to make propagation impossible.

It was generally felt that air must be saturated by vapor and not merely by the entrained particles of moisture from a spray, however minutely divided. It had been found that only 10 ft. to the leeway of such a spray might be found dust that could be ignited, showing that the air was not really saturated.

In response to a question Mr. Paul said that to render coal dust safe against explosion varying quantities of rock dust were needed. Some would be rendered safe by the use of 40 per cent of rock dust, others required 60 to 70 per cent, the quantity being readily determinable by experiment.

S. A. Taylor was asked to answer question No. 7—"What is the solution for the overdevelopment of the bituminous-coal industry?" Mr. Taylor said that he had estimated for the Garfield administration that the capacity of the bituminous-coal mines was a billion tons annually. Authorities in Washington placed the yearly capacity at 750,000,000 to 900,000,000 tons.

He declared that he did not believe that the production of coal would mount as steadily in the future as in the past, for coal was being better utilized now that central power stations were superseding the isolated plant and water power was displacing steam in the West and in Canada. Coal mines hereafter will be larger. We may look for an end to come to the many small mines that have hitherto been opened along the lines of established railroads. Mr. Taylor said that more and more does it become necessary, if any new mine is to be constructed, to build big plants capable of drawing on the coal land well back under the hills.

He added that several cures for the overdevelopment of mines had been proposed. The miners' union wanted a shorter day and a shorter week. Great Britain had the seven-hour day, but the results were not favorable to the mine workers or the operators. The suggestion of the mine workers, moreover, was not economic. Government ownership of coal land had been advanced as a means of promoting conservation and a deterrent of overdevelopment.

Others had advocated putting the opening of new mines under the control of the Interstate Commerce Commission, the need for new mines being certified in each case by the U. S. Bureau of Mines, but it seemed unconstitutional to favor operating corporations as against those who so far were not working their lands. Mr. Taylor quoted Herbert Hoover as saying that supply and demand would rectify the overdevelopment, and therein seemed to lie the wisest solution.

Don't Make Railroad Pay for Mine Surplus

It would be unfair to the railroads to compel them to meet the peak demands of the mines by unduly large purchases of equipment which would be idle many months in the year. He favored basing freight rates on the engineer's estimate of haulage costs and terminal expense. This would eliminate those mines which were worked only by virtue of freight rates that had been made unduly low for the especial purpose of enabling these mines to enter the market.

G. H. Ashley wanted the date of the wage settlement changed from April to July 1. Now we have a cold-weather peak at the same time as a peak caused by the desire to get coal for storage against a possible strike. Mr. Taylor responded that the busiest time in the Pittsburgh region was in the spring. The Pittsburgh operators would be willing to delay the question of settlement until July 1, but the Middle West, which mines coal mostly for domestic purposes, finds its mar-

ket briskens later when the public begins to stock up for the winter. Consequently the date of settlement has been much debated. The mine workers favor April 1 as the date, because they can find work in the spring which is not available in the winter.

In reply to question No. 4 it was stated that the mines should view the tie question in the same way as the railroads as far as the adzing or sawing of the timber is concerned. It is true that some mine ties are always wet but most of them are like railroad ties—wet occasionally and dry at other times. The railroads have concluded that the adze closes the pores and that the saw opens them up. With the adzed tie also only two sides are smoothed and the pores on the other two sides are in a state of nature. Unfortunately when a tie is not sawn it takes more room in a freight car and is heavy out of proportion to its effective size. Where a tie is sawn it will the more readily absorb preservative. Consequently it is best to use a sawed tie if, for the purpose of prolonging its life, it is to be given a bath or a brush coat.

The ayes had it unanimously in the question, "Are doors necessary in the ventilation of a gaseous mine?" C. P. Byrne, who made the main reply, stated that he had never seen a mine that could be ventilated without doors, and Mr. Ross said that this was particularly true of the anthracite mines.

Pennsylvania Danger Sign in Many States

Question No. 10 had evidently aroused some feeling. It ran, "Would there be any advantages in having a national danger sign for use in American coal mines?" G. H. Dyke in reply said the National Safety Council's universal sign, though carefully selected by experts after due experimentation, did not seem to be coming into general use. He recommended that the Pennsylvania sign for danger be adopted throughout the mines of the United States and that a committee be formed to hasten its adoption. Mr. Maize said that the Pennsylvania sign, a red oval with a black background and "Danger" in white letters, despite all that might be said about the uselessness of a black background in a dark mine with black coal in the rear, was giving satisfactory service. W. G. Duncan said that the use of the danger sign had so far not been enforced in the anthracite region and that the law did not require its enforcement.

W. H. Howarth and Sim Reynolds favored the universal use of the Pennsylvania sign. The general feeling was that someone had some other sign in view for universal adoption, and this caused somewhat general indignation, but Mr. Maize admitted the question was his and he favored the use of the Pennsylvania sign. G. H. Dyke said that the sign which the Pennsylvania Department of Mines had prescribed was selling all over the country including the anthracite region. Its adoption seemed to progress without any formal action.

D. J. Price, engineer in charge of grain-dust explosion investigations of the U. S. Department of Agriculture, in a paper on that subject, which he has made his especial study, said that the inquiries of the U. S. Bureau of Mines furnished the foundation for the researches of the Department of Agriculture into explosions of all kinds of industrial dusts.

In the afternoon G. A. Richardson showed his slides and moving pictures of the Rosedale mine and by-product plant, and A. C. Callen, professor of mining, School of Mines, West Virginia University, Morgantown, W. Va., gave an address on "Methods of Education in Coal Mining." He said that in Illinois, mining classes were being held in twenty-three towns, in Pennsylvania in twenty-four towns and in West Virginia in thirty-one towns. In West Virginia 1,096 men were enrolled and about 800 attended the classes weekly. The average class contained twenty-five men.

He believed in itinerant instruction. Local instructors might do the work at less cost but they did not attain the same success. Few of them gave the necessary time to the task. Being local men they did not have the respect shown them that was accorded to men from the outside. In fact he would not let any man instruct in the section from which he came for this very reason. The period of instruction lasted over two years.

In many places the superintendent and mine foreman attended and solved their questions on the board with the rest. At one point a district mine inspector made it his practice to attend. The presence of these men was stimulating to the class and really in some degree helpful to themselves, for a little refurbishing of facts and ideas is always well.

After Professor Callen's address, Edward Steidle, supervisor, co-operative mining department, Carnegie Institute of Technology, Pittsburgh, took the chair and Question 11, propounded by D. L. Boyle, was discussed. He wanted to know why all Pennsylvania mines should not be inspected by the Pennsylvania Inspection and Rating Bureau and duly rated, whether they were insured by the state, the stock companies or the mutual companies or were self-insured.

Company's Own Safety Inspectors Preferable

William Patterson declared that the safety inspectors of the coal company's own staff were more careful and more reliable than those of the bureau because they were always on the job and did not have to visit so many mines. As they learned to know intimately the few mines they had to inspect they could more readily detect hazardous conditions such as it was the interest of the employees of insured companies to discover. Besides, he alleged, the anxiety to get business sometimes made the insuring companies disposed to give a rating that the condition of the mine would not justify.

It was explained that as the law was framed the bureau was not allowed to inspect self-insuring mines. In no case could the rating inspectors order changes in the conditions. It is true that they could raise the insurance rates in accordance with a schedule, but even that they certainly could not do with a self-insuring company.

Question 12 asked, "At drift or slope mines where the coal is 3 or 4 ft. thick are rotary dumps more efficient than crossover dumps?" The answer to the question appeared to indicate that at a mine where the number of cars dumped depended on the capacity of the dump to discharge coal the endless crossover dump had an advantage over the type of rotary crossover which dumps only one car at a time, but the opinions expressed differed as to the relative merits of the two kinds of dump where in the case of the rotary dump provisions have been made for the dumping of two or more cars concurrently and where in either case the dumping capacity is not the question which is directly at issue.

Question No. 13, "What is the best type of head block—pressed or welded—and why?" was answered by

Mr. Bryant. He said that the compressed-terminal bond gave satisfactory results when the track was dry and the temperatures were even. Properly installed this bond gave satisfactory service, but when once it began to fail it deteriorated rapidly. It might serve its purpose excellently for ten, twelve or even fifteen years. On the other hand a bond poorly put in by the same man might show rapid deterioration. The hole must be absolutely clean and therefore must be drilled without lubrication.

Electric Welds Displacing Compressed Terminal

Investigation showed that the electrically welded bond was fast taking the place of the older compressed-terminal bond. Today 64 per cent of the new bonds were welded and only 36 per cent were compressed-terminal bonds. A few years ago the latter bonds were much more popular, the welded bond being comparatively rare. Another member said that the welded bond was either a good bond or a 100-per cent failure.

It was stated that at the meeting of the West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers in Huntington, W. Va., several rails with welded bonds were tested and that it was found that the welding crystallized the rail and weakened it, the rail breaking in every case at the point of welding.

Question 14, as to the most effective methods of reducing the present appalling rate of fatalities in coal mines from "falls," brought out the remark that one member had spoken to his men by attempting about their families and by suggesting that in neglecting safety the men were jeopardizing not only their own lives but the happiness of their wives and children. The thought of leaving them dependents with no one to care for them had more effect than the fear of the mines for his own life. Mr. Maize recommended the extensible use of the center prop.

Relative Value of Near and Far Coal Land

Thursday's meeting closed with a paper read on behalf of Bernard J. Reis on "Depletion, Depreciation and Other Factors Bearing on Cost." He urged that the coal near a mine opening or near a railroad sold at a higher price than coal that was more distant and consequently the whole cost of the area held by the operating company should not be divided by the whole anticipated tonnage of the territory to be operated when the depletion of the value of the property per ton mined was being computed. The actual value of the coal depleted should be taken and no other. Otherwise too large a depletion would be charged at a later period and profits would be declared at first which would be excessive and would represent not operating profit but profit plus a return part of the original capital.

The last expression from the meetings was the invitation ring in the last day of the annual session. Those who were able to stay over were well repaid for their tarrying, the objective the Springdale mine and central station of the West Penn Power Co., offering much of an instructive nature.

At least seventy-five were intercepted from Pittsburgh by Springdale, Pa. The meeting was spent looking through the central station. Divided into manageable groups, the visitors were familiarized with the power-generating operations and power distribution in the tri-state system. A luncheon still to learn pulverized coal, now being erected, attracted considerable attention.

The party then motored to New Kensington, Pa., where lunch was served. On their return to Springdale the men congregated in the main hoist house, where they were furnished with slickers, storm hats and safety lamps for their trip through the tunnels under the Allegheny River. Descending the stairway in the main shaft, an inspection was made of the big bottom with its rotary dump and skip-hoist arrangements.

A trip of ten all-steel 3½ ton mine cars such as are used in the Springdale mine carried the visitors through the river tunnels, during the course of which they were told of the difficulties encountered in solving the problems of the subaqueous construction. Arriving underground on the Logan's Ferry side of the mine the members were conducted to the airshaft, which elicited deep interest because of its huge proportions and its four-way split passages at the bottom. A well constructed first-aid room and a recently completed pump station with a 3,000,000-gallon sump offered suggestions aplenty. An ascent of the manway of the double-decked slope brought the men to the surface on the opposite shore of the river from the power station.

Safety Provisions Not Neglected at Mine

Here the slope hoist room, the substation, and the fan house were visited. An inspection of the orderly and well-lighted supply room and machine shop occupied some time. Here also a demonstration was made in a smoke chamber of the use of the carbon-monoxide gas mask.

Filing down the slope again the visitors walked to the east section of the mine and inspected the coal faces and other conditions on the main east entries. Few companies have adopted safety precautions on so large a scale as this one and the visitors did not fail to note these. Among them were large clean airways, electric lamps on the manways, crossover bridges over the haulage tracks, well-guarded trolley crossovers and a liberal application of whitewash on roadways.

A return to the Springdale side through the river tunnels in mine cars and a climb up the stairs brought the men to the surface and the convention to a close.

THE EFFECTIVENESS OF THE STEPS taken by the administration during the coal strike, looking to the prevention of a runaway market and an equitable distribution of coal supplies may be judged best, Secretary Hoover points out, by the fact that no acute hardship has followed the long period during which many mines were closed and by comparing the average prices that have prevailed since the strike with those that prevailed during the corresponding period following the strike in 1920. He emphasized, however, that domestic consumers will have themselves to blame if they do not provide substitutes for anthracite. There is not enough anthracite to go around and this condition must be recognized instead of relying on someone else to do the substituting.

UTILIZING THE SERVICES OF 194 RAILROAD CARS the United States Coal & Coke Co.'s mine at Lynch, Ky., on Dec. 5 loaded 10,573 tons in nine hours, the greatest output in its history. All this coal passed over one tipple and is derived from two openings. E. V. Albert is the general superintendent.

Problems of Operating Men

Edited by James T. Beard

Driving Wide Rooms a Factor in Maximum Unit Production of Coal

Conditions Affecting Maximum Unit Production—Necessity for Freedom of Movement in Mining—Requirements in Driving Wide Places—Objections to the Same

IN HIS letter, *Coal Age*, Oct. 26, p. 676, L. F. Klinginsmith requests a discussion of what influence, if any, the width of rooms has on the possible daily output, per man. In response to this request, I would like to offer the following remarks as being pertinent to that question.

The correspondent appears to be of the opinion that a wide room, or working place, will tend to produce a maximum tonnage, per man. In that connection, allow me to suggest that, aside from the prowess of the miner, the production of a maximum daily tonnage is largely dependent on certain physical conditions in the seam and the extent to which these are considered in the working out of the coal.

Miner Must Have Room to Work to Develop Full Capacity

In the first place, it is very essential that the miner should have freedom of movement. For instance, the place must be of sufficient width and arranged in a manner not to impede the loading of the coal. In this respect, it must be remembered that the width of the room is not necessarily the dominant factor.

For example, a 10-ft. entry if unobstructed may afford greater freedom of movement than a 20-ft. room where the roof conditions require the setting of posts so close together and near to the face of the coal as to provide little room for the miner to work.

On the other hand, where the conditions of roof and floor permit the driving of wide rooms, a single mining across the face of the room will produce a correspondingly larger tonnage and less time will be lost in the mining of the coal or in waiting for the machines to cut the face.

Wide Openings Assist Breaking Action of Roof

Again, the cantilever action of the roof is more effective in breaking down the coal, where the width of the opening is such as to throw the pressure on the face of the coal. A greater width of coal face will also greatly facilitate the setting and loading of more care at one time than is possible in a narrow place.

In respect to expediting the loading of coal in a working place, a most important matter is the arrangement of the track in the room. Where proper attention has not been given to this arrangement, the result will be to largely offset any advantage that might be gained in working a wide breast of coal.

Location of Track Important

The distance the miner must handle his coal along the face will largely determine his speed of loading. For this reason, conditions permitting, laying the track in the center of a wide room is a decided advantage over laying a track along the straight rib; but this must always involve the question of relative cost of the upkeep of the road, in the two cases.

Conditions may enable the driving of double rooms in which a track is laid along each rib. This will prove a distinct advantage in drawing back wide pillars. Briefly summarized, the driving of wide places, consistent with the prevailing conditions, favors a maximum production of coal, per man, by yielding a larger tonnage, per cut, and expediting the loading of the coal, where proper attention is paid to the arrangement of the tracks in the rooms.

Precautions to Be Taken When Driving Wide Rooms

Personally, I do not advocate the driving of rooms of a greater width than the local conditions and facilities of loading will permit. With wide rooms and proportionately large pillars, there is not the sustaining resistance to roof pressure as with a larger number of pillars of a size suitable to the conditions.

Under the conditions named by the correspondent, however, the driving of wide rooms will require the exercise of the greatest care in maintaining and form pillars. Lack of uniformity, size of pillars and the manner in which they are drawn back will result in an uneven distribution of roof pressure and create a disposition or tendency to creep.

The chief objection to wide rooms, driven under any roof conditions, will be found to be the danger of trouble in the later extraction of the pillars. In my judgment, the driving of rooms from 35 to 40 ft. in width, with pillars of proportionate distance, is apt to develop a dangerous condition when drawing back the pillars.

Owing to the large area of extraction, not only is there greater danger to the miners robbing the pillars; but there is every possibility of a crack extending back into the room a considerable distance beyond the breakline. If this does occur there is bound to result a total loss of large quantities of coal and material.

When the Fight Breaks Quickly

In the present instance, the coal being overlaid with a sandrock roof, it is probable that the initial break will only take place after a considerable area of pillar extraction is accomplished. The resulting heavy fall of roof may release large volumes of inflammable gas, with every prospect of a disastrous explosion taking place.

In any event, the cantilever action of the roof, increased by the extended area of extraction, cannot fail to have a destructive influence on the pillars and stumps yet remaining, to which I have previously alluded.

Taking these conditions into account, I consider it always objectionable to sacrifice future production to a temporary maximum output. This should be made subservient to economic production and development. It should be the aim to maintain a sufficient number of working places that will not compel the men to be crowded together so that they cannot work to the best advantage, and develop the highest productive capacity of the individual. Lastly, it is of the utmost importance to arrange the schedule for the cutting of the coal in a manner that will insure no delay in its loading. There must also be an adequate supply of cars at each place.

Washington, D. C. T. C. Taggart

Practical Safety-Lamp Test

Lamp to be surrounded with fine wire gauze and exposed to explosive. Flame in a closed chamber and water used to generate gas.

READING the short letter of a Pennsylvania [illegible] *Coal Age*, Nov. 9, p. 770, in which he describes his method of testing a safety lamp by means of a carbon lamp brought in proximity to the gauze of the safety, I am prompted to give the following practical test of a safety lamp, to [illegible] the real purpose:

[illegible] from asking the question, Will some means or system that will insure safe mining ever be found through study and investigation?

Mine Disasters Continue Though Knowledge Has Increased

Notwithstanding the rapid increase in the knowledge of mining conditions, brought about through our study and investigation, the past month or six weeks have recorded many fatal mine disasters, both in this country and elsewhere. It is appalling when we stop to think of the number of lives that have been sacrificed in these dread happenings.

Many of the disasters can be traced to the careless act of some ignorant or thoughtless miner, while others must be charged to the disregard and indifference of certain mine officials to safety rules and regulations. Operators must not cease their efforts to eliminate all known sources of danger and see to it that safety rules and regulations are strictly enforced, with suitable penalties.

Incompetent Officials Often Take Unwarranted Risks

It is with deep regret that we acknowledge a goodly number of our coal operators, though well meaning men, know very little regarding their underground operations. The most of these operators employ careless and incompetent officials, with the result that an explosion or other mine disaster follows. Many are in the mining business for the purpose of making all the money possible.

This latter class of operators are often willing to assume unwarranted risks and require to be carefully watched if their mines are to be operated in a safe manner. If the safekeeping of mines was a matter of heavy penalty for the violation of mining laws and safety regulations, we would soon have better mines and fewer disasters.

We often hear the question asked, "What are the chief dangers to be guarded against in coal mines and how can this be done?" The two chief elements of danger involved in the mining of coal are gas and dust. These must be guarded against in the operation of all mines. In respect to gas, adequate ventilation of the workings is the most effective means to employ. In the matter of dust, its removal and the humidifying of the mine air are the remedies.

Maintain Good Circulation

In his article, "Keeping the Mine Safe," *Coal Age*, Nov. 2, p. 719, Oscar H. Jones says: "One of the chief factors in mine safety is maintaining a good circulation of air throughout the workings." With this statement, I heartily agree. It hits the nail squarely on the head.

No mine can be considered safe or sanitary without a sufficient supply of fresh air at all times. A large volume of air circulated at a low velocity and made to sweep the working faces is a great safeguard of life in mining. All abandoned places where gas is wont to accumulate should be required, by law, to be kept well ventilated or substantially sealed with stone or concrete.

Good ventilation is the key to safeguarding the mine against gas. Dust is the dangerous element met with in all dry mines, the degree of danger varying with the inflammability and fineness of the dust. In my judgment, the dust danger is the most difficult one with which miners must deal and requires constant attention. Unlike gas, the danger from dust is increased by an abundant supply of fresh air.

Sprinkling or Spraying Inadequate

Again, quoting from Mr. Jones' letter to which I have referred, we find the statement: "In my opinion, no spraying system is thoroughly effective." Continuing, he does not believe that watering the dust renders it inexplosive or increases the safety of the mine. He regards the humidifying of the mine air and the broadcasting of salt more effective means of overcoming the dust evil.

In these respects, the correspondent has again clearly stated my own convictions regarding the dust evil. After a long experience in sprinkling dusty mines, and the use of spraying systems for laying the dust on mine roads, I have lost faith in the effectiveness of these means of overcoming the danger. Where there is much dust make the roads as wet as you may, today, and tomorrow they are dry again.

The most effective way of dealing with the dust question, in coal mines, is to reduce to a minimum the means for making dust. Permit no accumulations of fine coal at the working face. Load out all fines and coal cuttings in dustproof cars. Forbid the loading of cars with topping, and keep all haulage roads and travelingways clear. In addition to these precautions, humidify the intake current with steam.

Like Mr. Jones, I believe that, in all mines where the coal is hard and dry, blasting should be done with permissible explosives only and all holes should be tamped with clay. Preferably, experienced shotfirers should be employed to examine, charge and fire all shots after the men have left the mine.

JOHN ROSE.

Dayton, Tenn.

Determining Fault of Dislocation

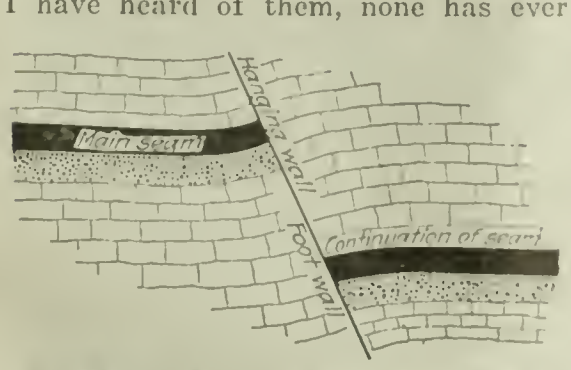
Normal and reverse faults—Ends of strata bent to show direction of the throw—Common rule is to follow the greater angle.

IT WAS with much interest that I read the letter of I. C. Parfitt, *Coal Age*, Nov. 16, p. 799, entitled, "Locating the Coal Beyond a Fault." The writer dwelt particularly on the direction in which the ends of the strata were bent at the point where the slip occurred.

The subject ought to be of deep interest to everyone in charge of coal-mining work. In my own experience, I have gone through many faults. At

times, it was necessary to drive long entries or slopes to connect with the continuation of the seam when that had been found.

Lack of Geological Knowledge



Owing to the lack of knowledge on the part of mine foremen and other officials, regarding the nature of faults and the means to be adopted to locate the seam beyond, there is often incurred much needless expense when an entry strikes a fault. In the majority of cases, there is much guessing as to the direction in which the strata has slipped.

Drillholes are often put up in the roof and down in the floor; or, perhaps, the heading is driven a considerable distance in the rock, in a fruitless endeavor to locate the continuance of the seam. It is needless to say that these efforts are largely without any intelligent direction and generally end in failure.

Causes Producing Reverse and Normal Faults

In the figure presented by Mr. Parfitt, there is shown what is termed a "reverse fault," which is evidently the result of contraction in the formation. The two sections of the strata were apparently forced together, until rupture took place and one portion then slipped under the other.

Such faults are not common. While I have heard of them, none has ever

NORMAL FAULT AS A DOWNTHROW

occurred in my practice. What I would term a "normal" fault is one where the strata were pulled apart by a force of extension till rupture occurred with the result shown in the accompanying figure. In this type of fault, it is clear that no drillholes, whether put up in the roof or down in the floor, would avail to find the coal. What I have to say, here, has reference to this more common type of normal fault.

Practical Rules for Finding the Coal Beyond a Fault

There are two general indications that intelligent miners seek when approaching a fault. One of these has been referred to by Mr. Parfitt; namely, the bending upward or downward of the ends of the strata at the fault line. It is my experience that the coal rises when the fault is a downthrow; and dips when the fault is an upthrow. This characteristic of a normal fault is shown somewhat exaggerated in the figure.

A practical rule that I have found has never failed to get the coal, is to follow the greater angle between the floor of the seam and the line of fault. This rule, of course, would not apply to a reverse fault, where it would be necessary to follow the lesser angle to get the coal beyond the fault line.

In reference to the bending of the ends of the strata, in a faulted seam, it will sometimes happen that metamorphic action has destroyed these marks and rendered the cleavages practically indiscernible. It will be interesting to learn the experience of others regarding these indications.

Linton, Ind. W. H. Luxton.

Inquiries Of General Interest

Method of Humidifying Mine with Steam When Ventilated by Exhaust Fan

Use of Steam in Exhaust System of Ventilation—Changes Required to Avoid Annoyance on Haulage Roads—Heating Intake Air Before it Enters the Hauleway

AT THIS season of the year, the subject of humidifying mines is one of absorbing interest. Recently, this interest has been much increased by reason of the numerous reports of mine disasters that have occurred in different localities where coal is being mined.

Mine explosions reported within the past two months have occurred in widely distributed parts, the territory covered extending from Vancouver Island in the northwest, to Alabama and including England. This wide distribution of mine catastrophes, in connection with repeated volcanic eruptions and destructive earthquakes during the same period, awakens renewed interest in the possible connection of seismic disturbances and gas in mines.

However this may be and whatever may have been the causes of the ignition of gas and dust that created these recent disasters, it behooves all coal miners and operators to exercise every precaution and seek to avoid danger by reducing, as far as practicable, explosive conditions in the mines. With this end in view, I am constrained to ask *Coal Age* and its readers for suggestions regarding the application of steam to humidify mines ventilated on the exhaust system.

In an excellent article that appeared some time since in *Coal Age* (Aug. 3, p. 169), the use of steam for this purpose was fully explained. Its application in that instance, however, clearly related to mines ventilated by the blowing system, which lends itself readily to the introduction of steam to the intake airway.

In the exhaust system of ventilation, on the other hand, the conditions are different, requiring the main haulage road to be made the intake airway for the mine. In that case, whether the mine is opened by a drift, slope or shaft, it is evident that the introduction of steam in the intake current would greatly hinder the haulage operations and prove a decided annoyance to workmen on that road.

The question I would like to ask is: Under these conditions, how is it practicable to humidify a mine ventilated on the exhaust system? There are hundreds of mines ventilated in this manner and a practical answer to this question will be greatly appreciated by many, at this time.

——, Ky. Superintendent.

In presenting his case, this correspondent has brought forward a matter of much importance in reference to humidifying mine air where exhaust fans are used. As he has stated, the blowing system of ventilation is ideal for the application of steam for the purpose mentioned, since the main haulage roads

MAIN HEADINGS LEADING INTO MINE

are then the return airways of the mine and the introduction of steam in the intake does not interfere with hauling the coal.

Perhaps the best answer that can be given to this question is to cite an instance of an exhaust mine that was, with slight alterations or changes, adapted to the introduction of steam for humidifying the mine, without interference to the operations of haulage and handling of cars at the mine entrance.

Although the answer about to be given relates to a mine in which the arrangements shown in the accompanying figure will apply equally well as in a mine or a shaft bottom, as far as the effect in the mine is concerned. If the mode illustrated in the figure was practicable, it was located at one side of the drift mouth, as near entrance A. The discharge

moisture. The air current is thus enabled to completely absorb the steam as it issues from the ends of the pipes and strikes against the baffle curtains hung in the airway.

Therefore, after passing these curtains, the air current presents a dry but saturated condition, at a moderately high temperature. By the time it has reached the main haulage road at *C*, and mixed with the cooler air entering the mine at *A*, it begins to deposit its moisture as the temperature falls.

When this arrangement is carefully followed, there is no appreciable fog formed on the haulage road that would inconvenience the drivers and other workmen. We shall be glad to have the question of practical humidification of mines, in the exhaust system of ventilation, further discussed, giving results actually obtained as to temperature and percentage of moisture at different points in the mine and the effect in overcoming the dust evil prevailing in coal mines.

Examination Questions Answered

Miscellaneous Examination Questions

(Answered by Request)

it has once been started in the workings of a dusty mine.

QUESTION—*(a) If the velocity of an air current is 700 ft. per min. and the size of the airway is 11 x 6 ft., what is the volume of air passing? (b) Show the perimeter and give the rubbing surface, the entry being 2,700 ft. long.*

ANSWER—(a) The sectional area of this airway is 6 × 11 = 66 sq. ft. The volume of air passing, at a velocity of 700 ft. per min., is 700 × 66 = 46,200 cu.ft. per minute.

(b) The perimeter of this airway is 2(6 + 11) = 34 ft. The rubbing surface of the airway is then found by multiplying the perimeter by the length of the airway; thus, 34 × 2,700 = 91,800 square feet.

QUESTION—*State the different methods of timbering hard roof and soft bottom, and hard top and soft bottom.*

ANSWER—When the roof is bad and the bottom soft, it is necessary to use good cap pieces above the posts, for the better support of the roof. Also, each post must be set on a good foot board so as to distribute the pressure more evenly and prevent the post from sinking into the soft bottom. Where the top is hard and the bottom soft, good foot boards only may be needed.

QUESTION—*(a) Give the essential requirements for a well ventilated mine. (b) Why is it necessary to take measurements of the air at certain intervals throughout the mine?*

ANSWER—(a) In a well ventilated mine, the volume of air entering the mine must be sufficient to comply with the requirements of the mining law of the state where the mine is located. In addition to this, the quality of the air and the velocity of the current at the working face must be sufficient to make the place safe and healthy for work. Simple compliance with the requirements of the mining law does not necessarily insure good ventilation, which depends primarily on the quality and velocity of the air at the working face. In every case, the condition must be such as to render all places healthy and safe for work.

(b) Air measurements should be taken at intervals throughout the mine, in order to determine any losses that may occur by reason of leaky doors and stoppings, so that these can be repaired and the entire volume of air made to sweep the working faces throughout the mine.

QUESTION—*(a) What elements determine the ventilating pressure? (b) What determines the air resistance and how is it measured? (c) What is a booster fan? Do you consider a booster fan practicable? Give reason for your answer.*

ANSWER—(a) The ventilating pressure, or the pressure producing circulation in the mine, is determined by the mine resistance.

(b) Resistance to the flow of air in a mine is determined primarily by the extent of rubbing surface and the velocity of the air current. In addition to these elements, the resistance is greatly modified by the amount of obstruction to the free passage of the air, owing to roof falls, contracted breakthroughs, or other hindrances in the airway.

Mine resistance is measured by observing the reading of the water gage, in the fan drift or at the shaft bottom. The water-gage reading, in inches, multiplied by 5.2 and that product again multiplied by the sectional area of the airway, in square feet, will give the mine resistance, in pounds.

(c) A booster fan is a small fan installed at some point in the airway of a mine, for the purpose of improving the ventilation in a given section of the workings. A booster fan is generally operated by an electric motor.

The use of a booster fan is never practicable if employed as a unit of the permanent circulation in a mine. Its use is limited to improving the circulation, temporarily, in a section of a mine, about to be abandoned and where the conditions do not warrant incurring any unnecessary expense for ventilation.

The reason why a booster is not a practical means for increasing the circulation in a mine, permanently, is because the location of the booster requires its constant watching to prevent accident resulting from possible failure in its operation. Also, the location of such a fan renders it unavailable in case of accident occurring making it important to restore the circulation before entering that section.

"Better Settle for Year at Present Wages on Four-State Basis," Big Western Operators Now Say

Big coal operators of the Middle West are reaching a new decision about what ought to happen April 1. Opinion is fast crystallizing in favor of making a settlement with the union miners at the present scale to run one year. The fact that John A. Donaldson, of Pittsburgh, Pa., one of the chief opponents in the recent Chicago meetings of re-establishment of the old four-state plan of scale making, is reported to have changed front and now favors the four-state plan is an important factor. It is important also that the central Pennsylvania operators are reported to be willing at last that this should be done. Thus, is spite of what the horde of small operators and the outlying districts may think, the situation is shaping up for a quick decision by operators and miners at the Jan. 3 scale conference at Chicago in favor of negotiating a one-year, four-state contract at present high wages, serious though the consequences may be to smaller and weaker coal producers in face of the probable poor market next year.

The one-year plan is said to have been approved by the miners, who feel so secure in their strength to whip the operators under any conditions at any time that they would just as soon put off the finish fight—if there is to be one—until April, 1924. There has been no official decaration on this point from Indianapolis, of course, but the word has passed around that John L. Lewis will agree to the one-year contract provided no reduction in wages is insisted upon.

Four of the principal operators whose headquarters are in Chicago agreed during the past week that they have concluded that a settlement with the union April 1 is essential. A strike, they say, will inevitably bring down some sort of government control through the agency of the Federal Coal Commission, and neither miners nor operators desire that. If settlement is made for one year, then time will have been allowed for the commission to do its utmost for the industry. At the end of the year, with the commission's work done, the deplorable labor situation in the industry may have been changed somehow so that the balance of power may not lie so completely in the hands of the union. Possibly other corrections of the industry's ills will have been made. In any case the spring of 1924, with no Federal Coal Commission in existence, is now looked upon by the large Western operators as a better time for a finish fight with the union than April, 1923.

It is prophesied freely enough that a continuance for another year of the present wage scale would simply spell ruin for hundreds of operating companies the country over. But the defence of those who would avoid a strike is that the public is in no mood to stand for another conflict between operators and union. Further than this, it seems evident that official Washington favors a settlement even at the present scale. If it is made, the larger operators say they will feel that they have shown their entire willingness to do their bit for the general good of the country. That is, they think they will have bowed to what they consider to be the will of the people, foolishly conceived though that will may be.

The indications now are that on Jan. 3 when the subcommittee of two miners and two operators from each of the fifteen union districts get together for a last minute effort to frame up a negotiations plan before the main scale conference convenes that same day, a hasty recommendation will be written favoring four-state negotiations. This is the subcommittee which spent more than a week in two Chicago sessions, Nov. 14 and Dec. 6, without reaching any conclusion. But whatever this subcommittee may do, it now appears likely that the main conference will set up the Central Competitive Field once more and that a settlement with the union will be made.

Case In Against First Herrin Defendants; Defence Begins Three Weeks' Grind

The state's full case against the first five prisoners in the Herrin massacre trial at Marion, Ill., is now in and the defense put a few witnesses on the stand just before adjournment until Jan. 2. No important new angles have been introduced. The state's witnesses presented more evidence supporting the direct charges of murder against all five prisoners, the witnesses reciting further details of brutality toward Howard Hoffman and C. K. McDowell previous to the killing of those two non-union members of the Lester strip mine's force on the day last June when the mine was besieged and 21 of the defenders killed and wounded after the whole force had surrendered. It was plainly shown by the testimony of first defence witnesses and by public statements by attorneys for the miners' union in charge of the case that "justifiable homicide" is to be the grounds of defence.

The defence put on its first witnesses on Friday, Dec. 22. John D. Conroy, farmer, union miner and contributor to the defence fund, whose farm is near the mine, told of being warned one evening about June 15 by an armed man on the road near his house not to "be around there after sunset or before sunrise." On the 21st he said he was fired upon from the mine as he went along the road, whereupon he ran into the farmhouse cellar with the rest of the family for protection. The next morning more shots were fired at him as he went out to the pasture after the stock. Conroy's father, mother and sister all told of the firing on the farm and of the killing of a colt. The elder Conroy, under cross-examination, could not be sure that the bullets were not overshot by mine attackers on the opposite side of the pit.

Ed Crenshaw, farmer and ertswhile miner, whose farm is near the strip pit, told of seeing Geordie Henderson, union miner, shot as Henderson lay on the ground 100 ft. from Crenshaw. He wasn't sure whether Henderson was armed or had been firing at the mine at the time. "Uncle Tink" Donahue, aged "character," whose farm is near the strip mine, testified that the guards closed a road he had been using as a public highway for 40 years. Walter Farry, highway commissioner of West Marion, said the road had been maintained with public funds. Oscar Daughar and his aged father, George Daughar, miners and farmers near the mine, told of bullets flying around the Crenshaw house.

Over the Christmas holiday prisoners and jurors were guarded in the county jail. Judge Hartwell warned witnesses to be ready promptly when court convenes Jan. 2. It is probable it will take the defense three more weeks to get its entire case in.

Howat Ticket May Have Won in Kansas

Results of the election, Dec. 12, of officers in District 14, United Mine Workers of America, over-Alex Howat, fornerly are still in doubt pending tabulating of the returns. Early reports were that the Howat slate, headed by William Howarth, candidate for president, was in the lead. The day after the election, however, Otis Glasscock, member of the International Board, United Mine Workers, and of the special election committee in charge of the election in District 14, declared there was little doubt but Clark, leading the Lewis faction, would win.

I. C. C. Issues Service Order 31

To insure adequate supplies of coal for the Government Fuel Yards at Washington, the Interstate Commerce Commission has issued Service Order No. 31, instructing the Pennsylvania R.R. to assign three cars per day for fifteen consecutive working days to the mine of the Consolidated Coal Mining Co. at Twin Rocks, Pa.

Senator Walsh Urges Seizure of Coal; Michigan Seeks Canadian Embargo

[illegible] Walsh of Massachusetts, advised state officers to commandeer and distribute coal necessary to prevent suffering, in a statement sent to his constituents and made public Dec. 26.

Prompted by reports of distress caused by coal shortage in New England, Senator Walsh, who said he had received many letters on the subject, took the unusual course of sending a circular letter to his constituents telling his efforts to prevent a fuel famine.

"I tried to arouse action of our government," he declared, "at a time when action could have been taken with advantageous results."

"Last summer," he added, "was the time to have compelled the necessary production and distribution of coal. The only immediate relief I can suggest now is for the respective state governments to commandeer whatever coal is available and apportion it equitably and at hard cost of production and distribution."

In his effort to obtain a more liberal supply of anthracite for Michigan and Detroit, Charles F. Dunn, Wayne County Fuel Administrator, is directing the attention of Representative Vincent M. Brennan to various features of the situation. Representative Brennan, it is said, will make use of the information in urging congressional action placing an embargo on shipments of anthracite to Canada.

Mr. Dunn informs the congressman that between Sept. 10 and Nov. 24 shipments of hard coal via Canada amounted to 13,536 cars, or 404,567 gross tons, while in the same interval Michigan received 2,947 cars, or 107,871 gross tons. It is pointed out also that the figures for Canada do not include shipments over the Delaware & Hudson, which is reported to have handled a considerable tonnage for Montreal, but the shipments carried out of Buffalo on lake steamers for delivery in Canada.

The fact that the railroads receive a freight rate of 67c. more per gross ton on shipments into Canada than the rate to Detroit and Michigan is suggested as one of the reasons for the apparent discriminatory diversion of anthracite into Canada.

Mines Bureau Fares Well in Appropriations

The Bureau of Mines fared particularly well at the hands of the appropriations committee of the House of Representatives. The only cut made in its budget was the lopping off of $10,000 from the amount requested for the investigation of mineral fuels. In that case the bill reported to the House carries $130,000 instead of $140,000. On the other hand, however, an increase of $20,000 was allowed for the supervision of petroleum leases on the public domain and $41,000 for enforcing the provisions of the leasing act with regard to coal, phosphates, sodium and potassium.

In the case of the Geological Survey the total carried in the budget was reduced by $136,400. The appropriations committee reported $225,800 for land-classification work, a reduction of $75,000. An additional $9,500 was lopped off of the amount requested for stream gaging, and $51,900 was withdrawn from the amount desired for geologic surveys.

Only Four Companies Bid on Coal Supply For Navy Yards and Naval Stations

Only four companies submitted bids Dec. 19 to the Bureau of Supplies and Accounts, Navy Department, for [illegible] coal for navy yards and naval stations. Only four bids were for the full list of more than one hundred, and on the items requiring 14,000 tons for delivery at Norfolk, Va., and 800 tons for delivery at Lee Hall, Va.—no bids at all were received.

In addition to the four bids mentioned at the opening, an informal proposal, which was not considered, [illegible] was received from the Madison Coal & Iron Co.

The bids received were as follows:

Empire Coal Mining Co., Philadelphia, 300 tons, for delivery at Hingham, Mass., $9.25 per ton; 900 tons, for delivery at Iona Island, N. Y., $7.98 per ton; 8,500 tons, for delivery at Lakehurst, N. J., $8.23 per ton.

Iron Trade Products Co., Pittsburgh, 300 tons, for delivery at Hingham, Mass., $8.41 per ton; 25,000 tons, for delivery at Brooklyn, $7.06 per ton, delivered at coaling plant, or $6.76, delivered into navy barges; 5,400 tons, for delivery at South Brooklyn, N. Y., $7.39 per ton, delivered in cars, or $6.76 per ton, delivered into navy barges; 900 tons, for delivery at Iona Island, N. Y., $7.15 per ton; 1,200 tons, for delivery at Lake Denmark, N. J., $8.04 per ton; 8,500 tons, for delivery at Lakehurst, N. J., $7.39 per ton; [illegible] tons, for delivery at Washington, D. C., $6.76 per ton; 500 tons, for delivery in the District of Columbia, $6.76 per ton; 400 tons, for delivery at Alexandria, Va., $6.76 per ton; 10,500 tons, for delivery at White Plains, Md., $7.34 per ton; 13,800 tons, for delivery at Annapolis, Md., $9.42 per ton, for large delivery, or $9.07 per ton, delivered by rail.

Quaker City Coal & Coke Co., Philadelphia, 8,500 tons, for delivery at Lakehurst, N. J., $7.11 per ton.

L. A. Snead, Washington, D. C., 400 tons, for delivery at Alexandria, Va., $8.50 per ton; 17,900 tons, for delivery at Sewalls Point, Va., $8.24 per ton; 3,400 tons, for delivery at Norfolk, $8.25 per ton; 4,000 tons, for delivery at Charleston, S. C., $8.64 per ton.

Beehive Coke Output in 1921, 5,538,042 Tons, Lowest Since 1885

Beehive coke production in 1921 was 5,538,042 net tons, the smallest record since 1885 and 73 per cent less than in 1920, according to the U. S. Geological Survey.

Byproduct coke continued to supersede the beehive-oven variety, for of the 25,287,22 tons of coke produced in 1921—both beehive and byproduct—but 22 per cent of the total came from beehive ovens against 40 per cent in 1920.

The principal facts concerning the beehive coke industry are revealed in the following tables:

TABLE I—BEEHIVE COKE INDUSTRY IN THE UNITED STATES IN 1921*

Beehive ovens:	
In existence Dec. 31, 1921	66,014
Newly completed during year	0
Under construction at end of year	0
Coal charged into ovens:	
Quantity, net tons	8,475,446
Average value, per net ton	$2 52
Beehive coke produced, net tons	5,538,042
Average yield of coke from coal, per cent	65.3
Coke used by producer, net tons	495,481
Furnace and foundry coke sold:	
Quantity, net tons	4,969,052
Average value, per net ton	$5 42
Domestic and other coke sold:	
Quantity, net tons	56,874
Average value, per net ton	$4.79
Screenings and breeze:	
Used by producer, net tons	10,520
Sold, net tons	12,910
Average value, per net ton	$3.06

TABLE II—THE BEEHIVE COKE INDUSTRY, BY STATES, IN 1921*

State	Coal Charged Into Beehive Ovens Net Tons	Beehive Coke Produced a Net Tons	Beehive Coke Used by Producer a Net Tons	Total Sales of Beehive Coke and Breeze Net Tons	Value
Alabama	223,119	132,912	69,586	63,133	$411,471

Incomplete Data Will Hamper Commission in Making Report Jan. 15; Important Deductions Likely

By Paul Wooton
Washington Correspondent of *Coal Age*

In making its Jan. 15 report the U. S. Coal Commission will be greatly handicapped by lack of complete figures, but it is believed many pertinent deductions can be made from the returns that will have been received by the time the report must be written. In that connection it is charged that returns have been delayed because an adequate supply of cost forms has not been made available. It is stated that the number of forms needed was underestimated. While it is probable that the number of companies which will require the C-1 form does not exceed 2,000, the average number which each company will require is large. This is due to the fact that many of the companies will make separate returns for each mine. Many of the companies operate in more than one district. Forms must be had for local associations and for the National Coal Association. Allowance must be made for work sheets and wastage.

Commissioner Neill has signed an agreement proposed by J. C. Bryden, chairman of the special committee of bituminous operators which is co-operating with the commission, whereby the name of the company, the location of its offices and the names of its mines may be omitted from the labor form povided that information is furnished on a separate sheet. A confidential identification mark can be placed on the sheet in lieu of the name of the company, which will be kept by the commission in a confidential file. The feeling is that the commission very properly may safeguard the business secrets of the reporting company, especially in such a matter as wages. On the other hand, it is equally apparent to all concerned that the commission cannot accept anonymous information, but it is a comparatively easy matter to identify reports in a manner which need reveal none of the information which would injure the individual making the returns.

The week of Dec. 18 was taken up largely in discussions between the commission and its staff and with Washington retailers. The amount of time which the commission has taken with the Washington retailers has led some to wonder how a body charged with responsibilities of such a pressing character can take up such details as have been under discussion. The thought is that such work should be left to field agents of the commission, although it is admitted that more profit than is apparent may come from these conferences. One outcome has been the tracing of high-priced coal, which has revealed some very significant information, it is believed.

George J. Anderson made a statement before the commission on Dec. 22 in regard to industrial relations in the coal industry. Mr. Anderson appeared at the request of the commission.

Supplemental instructions regarding the filling out of details of Form L-1, covering earnings of mine labor have recently been issued, as follows:

Referring to the letter of instructions for filling out the details in Form L-1, it was stated in the paragraph referring to column 48 that a formula would be sent later for deriving the net annual earnings. The method for deriving the net earnings is as follows: from the gross earnings subtract charges for items such as powder, dynamite and other kinds of explosives, caps, fuse, oils, carbide, smithing, etc. These are not given as a complete list but are typical of the kind of occupational expenses that are to be deducted, and if there are any items which are deducted at any particular mines and are not included in the above, and are of the same type of occupational expenses, they are to be included for that time in the items to be deducted.

The deductions are, of course, to be made only from the classes of employees against whom these charges are made. For example, the charge for explosives would be made against all classes of miners who actually pay for explosives, but would not be made against machine runners who were not required to work in occupations which required the use of explosives. Any amounts deducted for checkweighmen or check docking boss should also be subtracted from gross earnings in order to derive the final net earnings. Other deductions made on account of the union are not to be subtracted from gross earnings.

It is understood that in some cases only one general deduction is made for the union account and that this includes items for checkweighmen lumped in with the other items. In such cases the total

McChord and Eastman Reappointed

Charles C. McChord, of Kentucky, and Joseph B. Eastman, of Massachusetts, have been confirmed by the Senate for new terms as Commissioners of the Interstate Commerce Commission. The term is for seven years.

Utilities Proxy to Face Coal Commission

The President's Coal Commission will confer on Jan. 5 with J. W. Lieb, chairman of the [illegible] committee which the utility associations have set up. The commission expects to hear extensively from Mr. Lieb in regard to the problems and suggestions of large consumers of coal.

Preliminary Statistics of Production of Coal in 1921

(Recovery of product of wagon mines)

Bostrup, Henderson, Hopkins, Hooster, Leon, Medina, Milan ... sold to local trade. The total production of the state was ... (a) Gilmer and Sumners.

Collective Analytical Study of Costs Is Legal, Says Nelson B. Gaskill

Trade associations or groups interested in cost accounting have used safely for the purpose of the study of costs, the detection of errors and the improvements of their methods without contravention of law, in the opinion of Commissioner Nelson B. Gaskill, of the Federal Trade Commission. Mr. Gaskill further believes that it is perfectly legal to make reports of such conferences available to absent members, government agencies and other interested parties. This opinion was expressed unofficially by Mr. Gaskill in response to an inquiry from E. W. McCullogh, manager of the Fabricated Production Department of the Chamber of Commerce of the United States.

"To prohibit collective study of costs for the purpose of their analysis, the detection of errors, and the improvement of methods, is to shackle educative progress," Mr. Gaskill said.

Revision of Western Coal Rates Recommended in Tentative Report of I. C. C. Inquiry

Many revisions in the rates on anthracite and bituminous coal from mines in New Mexico, Colorado, Wyoming, Montana and other Western states are recommended in a lengthy tentative report submitted by Attorney-examiner M. A. Pattison, for the Interstate Commerce Commission, in Docket No. 13588, entitled "Western Coal Rates." The report summarizes "an investigation instituted by the commission on its own motion into the reasonableness and lawfulness of interstate rates on coal" in Western territory.

"Complaints against the rates on coal in this territory," the report says, "have been numerous, and those more recently considered have disclosed a lack of uniformity in the rate structure, both with respect to the measure of the rates and the relationships between the various competing mines and groups of mines, that appeared to call for a comprehensive inquiry." Cameron Coal Co. et al. vs. A. T. S. F. Ry. Co. et al., No. 9613, also is embraced in the report. Hearings, extending over seven months, were held at Denver, Salt Lake City, Butte, Seattle, San Francisco, Phoenix and El Paso.

Colorado and New Mexico shippers presented evidence on interstate rates from Colorado into New Mexico, Wyoming and other Western states as well as in regard to the intrastate adjustment in Colorado. After reviewing the evidence adduced the report states: "There appears to be no just reason why the Union Pacific should maintain rates from its northern Colorado mines to Cheyenne that exceed those from Hanna. For the future the rates from the two districts should be the same. . . . The Colorado & Southern and Burlington have met the rate of the Union Pacific from the Rock Springs-Kemmerer district, disregarding the additional haul from Kirby, but the former has failed to accord a similar adjustment to the Walsenburg operators, although their advantage is 23 miles as compared with Rock Springs-Kemmerer and 61 miles as compared with Kirby."

Discriminate Against the Walsenburg District

The report says, further: "If the Colorado & Southern and Burlington, affiliated lines, consider it a good policy to maintain the same rate from Kirby to Cheyenne as the Union Pacific maintains from the Rock Springs district, thus permitting the Kirby operators to compete on an equality with the Rock Springs operators, they should accord similar treatment to the operators in the Walsenburg district, whose mines are not only less distant from the common market but are served under no greater operating disadvantages than prevail generally in this territory. The rates from Walsenburg to Cheyenne should not be higher than $3.25, and in no event should exceed the rate from Kirby."

In regard to Montana rates the report states: "The rates from Sheridan to points in Montana on the Northern Pacific east of Billings should not exceed the rates from Red Lodge to the same points by more than 30c and to points on the line of that carrier west and on the Great Northern when routed via Billings by more than 45c. For the added haul of 124 miles from Kirby, rates therefrom should not exceed those from Red Lodge by more than 60c. Unless the authority of the Montana Commission is obtained for increasing the basic Red Lodge rates, observance of the differentials from Sheridan and Kirby must necessarily be accomplished by reduction. . . . A maximum differential of 25c. against the Sheridan mines at points west of Clark's Fork to and including Spokane would meet the desire of the Sheridan operators and would conform to the general rule of diminishing differentials with increasing distances. The present differential is less than the maximum here suggested as proper, and need not be changed . . . . The materially shorter distances via Sidney would seem to require the establishment of rates via that junction. Joint rates should therefore be published by way of Sidney from Sheridan to points on the Great Northern in northeastern Montana, to which the short-line distances over that route are shorter than through Havre, and such rates should not exceed the rates for corresponding distances from Sheridan to points on the Great Northern north of Billings. The rates via Billings and via Sidney should be restricted in their application so as to avoid fourth-section departures."

"The rates on coal from mines in Utah to destinations in Idaho, Montana, Oregon and Washington, referred to collectively as the Northwest" the report says, are higher than the rates from mines in the Kemmerer-Rock Springs district by from 22 to 45c and over, and one of the principal points of controversy developed in this investigation was the propriety of this adjustment. The Utah operators claim the right to a rate equality in this territory with their competitors in Wyoming. On the other hand, the Wyoming operators claim the differential should be substantially greater. . . .

"The operators in the Utah district protest against the inclusion of the mines in the Kemmerer and Rock Springs groups in one rate district and contend that it has the effect of moving Rock Springs, the principal shipping group, 47 miles farther to the west to the disadvantage of the Utah mines from a comparative distance standpoint. The Wyoming operators, who would naturally be presumed to have a greater interest in the grouping of their mines, are content with the present arrangement.

Adjustment Based on Consolidated Fuel Case

"The adjustment prevailing rates between the Utah and southern Wyoming mines on traffic to points routed through the McCammon or Pocatello gateway is the result of the decision in Consolidated Fuel Co. vs. A. T. & S. F. Ry. Co., 24, I.C.C., 213, decided June 3, 1912. On the date of that decision the rates to Pocatello were $2 from the Kemmerer-Rock Springs district and $2.25 from the Castle Gate district as then constituted, a difference of 25c.

"Consideration of the circumstances which brought about the establishment of the 25c. differential from the Castle Gate district as now constituted and the differences in the distances and operating conditions . . . leads to the conclusion that the Consolidated Fuel Co. case cannot be deemed controlling. A differential of less than 25c. per ton at McCammon will be for the future unduly prejudicial to the operators in the Kemmerer-Rock Springs district and unduly preferential of the operators in the Castle Gate district."

"The rate from the Kemmerer-Rock Springs district to Butte compares favorably with the rates from competing districts. The length of haul and the competitive conditions at Butte justify a slightly [illegible] differential against the Utah mines than at McCammon. A differential in excess of 40c. will be for the future unduly prejudicial to the producers in the Castle Gate district.

The report notes that "rates to Portland and Seattle are highly competitive," but states that "the Washington Coal Producers' Associat on does not in this proceeding attack the reasonableness of the rates now maintained by the carriers serving the Washington mines." The Washington operators oppose reduction in the rates from the Utah and southern Wyoming districts and contend that the present rates from those districts are too low.

In considering rates to San Francisco the report says: "No changes should be required in the rates from the Kemmerer-Rock Springs district except that the rates on nut and slack should not be more than 25c. and 75c., respectively, lower than the rates on lump. In recognition of the principle that as distances increase the differentials should decrease, rates from the Castle Gate district should be 10c. higher than those from [illegible] Wyoming. To Seattle, rates from the Sheridan, Red Lodge and Rock Springs [illegible]

...rates are the same, and from Utah 25c. higher. The distances from the Rock Springs and Castle Gate districts are greater to Seattle than to Portland or San Francisco, and the rates are properly higher. The differential against the Utah mines should be the same as at Portland, or 25c. per ton. The rates from the Kemmerer-Rock Springs districts to Spokane have been adjusted with relation to the rates from Roundup and Kirby and the rates from Utah are differentially related to those from southern Wyoming. The differential against the Utah mines is less than that found reasonable at Portland and should be increased to 25c."

On rates to points on the Southern Pacific in Oregon, the report states: "For the future the rates on lump coal from the Rock Springs district should not exceed $6.25 to Salem, $6.50 to Eugene, and $6.85 to Roseburg, Medford and Ashland, with corresponding reductions to other points north of Ashland. The rates from the Castle Gate district should be 25c. higher."

"There is no reason disclosed in this record, either from a transportation or competitive standpoint," says the report, "why the rates on anthracite coal from Crested Butte should be so much in excess of those on bituminous coal. For the future the rates on anthracite coal from Crested Butte to intermediate destinations should not exceed the rates contemporaneously maintained on bituminous lump coal to the same destinations by more than 50c. per ton. . . .

"The equalization of rates as between the Kemmerer-Rock Springs and Castle Gate districts at Ogden is maintained also at points in Utah north of Ogden, but at Preston and Malad, Idaho, the termini of branch lines of the O. S. L. extending from Cache Junction, Utah, and Brigham, Utah, respectively, rates from southern Wyoming are 25c. lower. The average distances from the southern Wyoming mines to these points over the routes through McCammon or Ogden, depending upon the point of origin, are 34 miles greater at Preston and 51 miles greater at Malad than the average distances from the Castle Gate mines. The differential against the latter should be eliminated. . . . The competitive conditions at Salt Lake City are more compelling than at Ogden. The Union Pacific should now be permitted to publish rates of $2.50 on lump, mine run and nut, and $2.20 on slack to points south of Ogden on the O. S. L. This will result in a differential of 40c. at Salt Lake City, which, in view of the relative conditions of operation on the Union Pacific and Rio Grande will not be too low. The maintenance of the present differential relationship is unduly prejudicial to the southern Wyoming operators. . . . Rates from the Rock Springs-Kemmerer district to points in Utah between Lyndyll and Uvada," the report states, "should be 75c. per ton higher than the corresponding rates from the Castle Gate district, and to Boyd, Nevada, and to points west thereof 50c. higher.

"Present relationships are unduly prejudicial to the operators in the Raton-Dawson field and unduly preferential of their competitors. Tha rates from the Los Cerrillos district to points on the Santa Fe and its connection west of Gallup should not exceed the rates on the same classes of coal contemporaneously in effect from Gallup to the same points by more than $1.30 per ton, which differential may be reduced on the longer hauls to competitive points in California. The rates from the Raton-Dawson district to these points should not exceed those from Los Cerrillos by more than $1.10. Rates from the Los Cerrillos and Gallup districts to points south of Belen appear to be reasonably related. To such points the rates from the Raton-Dawson district via the Santa Fe should not exceed the corresponding rates from Los Cerrillos by more than $1.10. . . . Under all the circumstances a differential of 15c. is justified and should be observed on all classes of coal, both eastbound into Colorado and westbound into New Mexico, Arizona and California. The rates from the Walsenburg district southbound should be based upon the generally recognized differential of 25c. over the rate from the Trinidad district."

Eleven Firms Submit Bids on 178,895 Tons Of Coal for N. Y. City Departments

Eleven bids were received by the Board of Purchase of the City of New York on Dec. 21 for furnishing and delivering to several of the city departments during the three months ending March 31, 1923, 178,895 net tons of coal, of which 59,641 tons is to be buckwheat; 10,080 tons, No. 2 buckwheat; 18,000 tons, No. 3 buckwheat; 36,253 tons, bituminous, run-of-mine; 5,000 tons mixed (No. 3 buckwheat and run-of-mine); 2,078 tons, pea; 247 tons, chestnut; 6,232 tons, stove; 12,694 tons, egg; 350 tons, coke, and 29,260 tons mixed.

The prices submitted showed a wide range. The lowest bids received for furnishing and delivering No. 1 buckwheat in the various boroughs ranged from $9.50 to $10.38; No. 2 buckwheat, from $6.60 to $7.69; No. 3 buckwheat, $5.60; bituminous, run-of-mine, $10.50 to $13.04; pea coal, $12.25 to $13.74; mixed bituminous, $12.40 to $14.54.

For barge deliveries of No. 1 buckwheat bids ranged from $6.82 to 7.98; No. 2 buckwheat, $6.19 to $9.98; No. 3 buckwheat, $3.97 to $5.60, and for bituminous, run-of-mine, from $9.74 to $10.95; anthracite, stove and egg, and coke (stove coal size), $14.25 each.

For carload deliveries of buckwheat No. 1 on Long Island there were two bids, $8.45 and $12.24, and for bituminous, run-of-mine, there were two bids, $10.95 and $11.14.

To Discuss Car-Distribution Rules

A conference between representatives of the National Coal Association and of the American Railroad Association will be held in Washington the week of Jan. 8 to discuss car-distribution rules other than those applying to assigned cars. An effort will be made to reach an agreement on as many as possible of the amendments which have been put forward. Others interested will be invited to this conference.

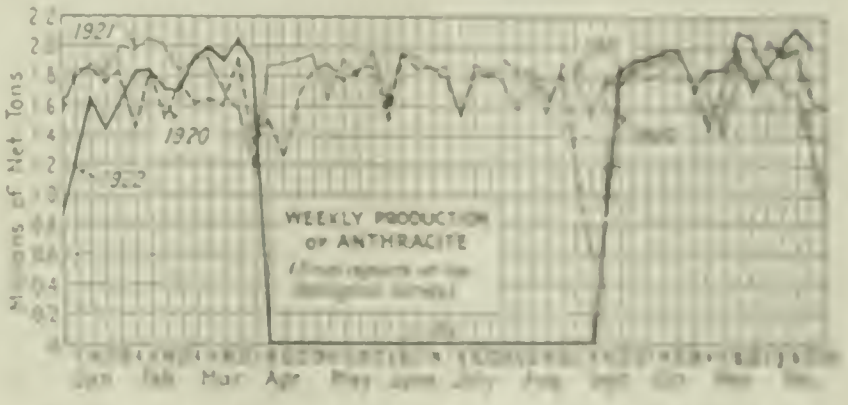
(b) Preliminary figures.

Production and the Market

Weekly Review

Transportation troubles and cold weather have bolstered a falling market and demand has grown by leaps and bounds during the past week. Crippling weather has proved too severe for the railroads and motive power has failed to carry the load. Engine trouble has slowed down the movement of loads and the return of empties, curtailing production, and the cold weather has swept a multitude of orders to the retailers. The indifferent attitude of industrial buyers has been upset and many of the smaller consumers have rushed into the market for immediate deliveries. Higher prices are inevitable under such conditions and *Coal Age* Index of spot bituminous coal prices rose 13 points during the week to 349 on Dec. 26, representing an average price at the mine of $4.23, compared with $4.07 in the week preceding. This is the highest mine price since late in October.



Pinch Tightest in North Atlantic Section

All markets are stronger, but the larger North Atlantic centers seem to be feeling the pinch more than any other section. Demand is tremendous as receipts continue to lighten and "coal is coal" with the market sensitive to every demand made upon it. Quality coals are off the market and intermediate pools show but little price range. The domestic situation in the East adds considerably to the shortage. Screened coals are in strong demand and attractive prices are being offered for quick shipment. The available supply is not large, however, and thus a considerable tonnage of inferior or poorly prepared coal is being loosed upon a brand new market. It is to be hoped that this practice can be checked or domestic soft coal will have its reputation ruined in this new territory almost before it has had time to be given a fair trial. There are a number of concerns shipping excellent domestic coals to New York who have built up a trade with much care, but the trend of market conditions is causing them anxiety lest their high-grade screened product be classified with the nondescript tonnage that a boom market always attracts.

New England consumers have ample reserves and while they must pay higher prices than a fortnight ago the condition of their stockpiles is all that keeps delivered prices from soaring. Offerings of Southern coal from Hampton Roads are light and high priced and this has improved the position of all-rail coal.

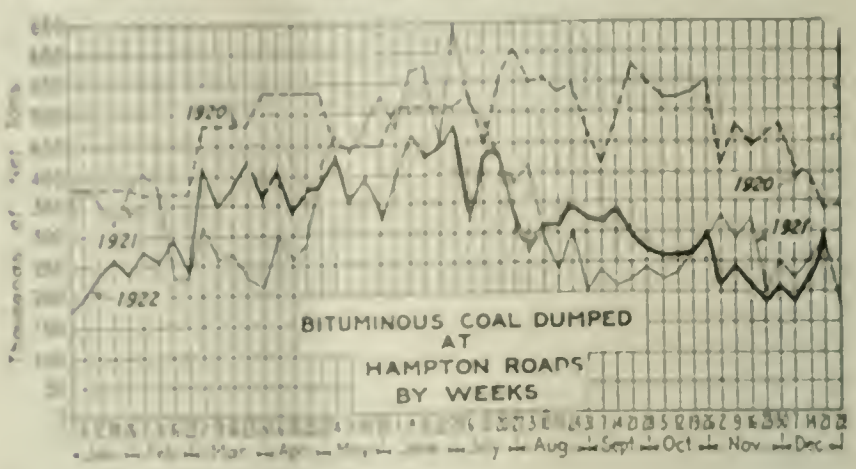
Sellers' Market Appears Almost Overnight

Screenings are very scarce in Chicago and the Middle West. The cold weather has increased the domestic demand and all prices are up. What was a surplus industrial market has been turned almost overnight into a sellers' market with buyers endeavoring to overcome their individual shortages. Illinois coals are in good demand in the Northwest, where brisk weather has

strengthened the market both all-rail and off the docks.

The Eastern Inland section is also experiencing a shortage, with slow deliveries aggravating buyers. Pittsburgh district coal is stronger, as local demand is good and the East is but after prepared sizes.

The retail trade is barely existing on the meager receipts of anthracite. Substitute bituminous fuel, snorted a few weeks ago, is in active demand and is fast being cleaned up. Retailers did not stock heavily



be welcomed substitutes met a very cool reception earlier in the season, and this sudden demand found most of the Eastern dealers unable to meet the situation. Buckwheat is in excellent position because of the scarcity of domestic anthracite and the smaller steam sizes of the independents are now selling at unusual prices.

Canadian buyers who had been bidding up the independent market have been checked by an announcement from Washington that shipments must be discontinued, temporarily at least, because of the acute shortage in the United States.

BITUMINOUS

Production of soft coal has been falling since the second week of December. Estimates for the week ended Dec. 16 show an output of 10,515,000 net tons, according to the Geological Survey and for last week (Dec. 18-23) around 10,000,000 to 10,300,000 tons. The decline began on Dec. 12, after the observation of miners' election day in some districts, and has continued since that date, which marked the first real wintry weather this year. It is generally attributed to the failure of the railroads' motive power to stand the strain of heavy traffic under unfavorable weather conditions.

November saw a production of 45,300,000 net tons—23 per cent more than during November, 1921, and only exceeded twice in the last ten years. Cumulative production for the year was 361,000,000 tons, or 6 per cent less than in 1921, a year of business depression. Largely on account of the strike, this was 30 per cent less than in 1920 and 20 per cent less than the average for the last nine years.

* Nominal. † Advances over previous week shown in heavy type, declines in *italics*.

Lake dumpings during the season were 19,330,860 net tons—18,501,055 tons cargo and 829,805 tons vessel fuel—as compared with 23,171,449 tons in 1921.

The all-rail movement to New England increased to 3,491 cars during the week ended Dec. 16, as compared with 2,872 cars during the preceding week. Central Pennsylvania is finding a better market in that section because of the rising of coastwise coal from Hampton Roads.

Dumpings at Hampton Roads were 300,552 net tons during the week ended Dec. 21, as compared with 257,326 tons in the preceding week. Supplies are divided among many houses, making cargo sales difficult. Shippers find that Western consumers are willing to pay high for Southern coals and this necessitates increases at the Roads to obtain tonnage from the mines.

ANTHRACITE

Production of anthracite during the week ended Dec. 16 was 2,197,000 net tons, the highest week's output in 1922. Early returns for last week indicate a diminished rate, with a probable total of 2,000,000 tons.

Buffalo dumped 1,070,680 tons of Lake coal during the season, as compared with 3,810,315 tons in 1921. December dumpings of 123,600 tons were heavier than expected. The Northwestern States must look to all-rail sources for a considerable tonnage to eke out this winter's needs and already some of them have requested Washington to authorize a priority movement of 250 cars per day of all-rail anthracite.

COKE

Beehive coke production was 298,000 net tons during the week ended Dec. 16, 7,000 tons more than in the preceding week. Connellsville production established a new high record for the year.

Eastern demand for Connellsville coke for domestic use has taken the situation out of the hands of the blast furnaces and foundries because of the higher prices being paid. The sudden shift of the market has suspended many contract negotiations for the first quarter, as operators now feel that they want their tonnage free to apply against the more attractive open market.

$1,000,000 Damage Suit Against U. M. W. Continued in Next Term of Court

The case of the Willis Branch Coal Co. against the international organization of the United Mine Workers, for $1,000,000 damages, set for trial in the U. S. District Court for the southern district of West Virginia at this term, has been continued until the next term of court. The company claims the above damages in connection with the destruction of its mining plant at Willis Branch, for which it alleges members of the United Mine Workers organization were responsible. The company bases its claim on the Coronado decision of the U. S. Supreme Court and contends that under the terms of that decision the miners' union is responsible for the acts of its members. The entire town was destroyed by members of the organization, it is alleged by the plaintiff in this case. Continuance followed an agreement between the parties to the suit.

JOHN HAYS HAMMOND HAS OUTLIVED the South African judge who sentenced him to death after the Jameson raid. That magistrate, who had acquired the title of "the hanging judge" died last week, according to press dispatches.

How the Coal Fields Are Working

[illegible]

Foreign Market And Export News

Heavy British Output Finds Ready Market; New U. S. Orders Placed

The South Wales coal industry is in a prosperous position such as it has not known for the past year. Demand is exceptionally heavy and nearly all mines have been reopened. The South American requirements are heavy and South Wales is no doubt benefiting from the absence of the United States as an active competitor for the trade with the Atlantic coaling depots and the South American countries. France is also an active buyer and Italy is increasing for approximately 600,000 tons. Last week the United States placed orders for 100,000 tons, delivery over the first half of 1923.

British production apparently knows no limit. The output during the week ended Dec. 9 was 5,827,000 gross tons, according to a cable to Coal Age, exceeding the preceding week's output, a record for the year, by 20,000 tons.

Shipments at the Welsh ports recently show very great strength. Until the three-shift system can be secured at the docks, it will be impossible to cope with this. Wages of the Welsh miners for December remain at the minimum of 2s per cent above the standard of 1915. October results show that the colliery workers, in order to make up the minimum wages, had to sacrifice a considerable part of their standard profits.

French Miners Again Seek Raise

Owing to the failure of Belgium and Italy to make the deliveries expected from them, the domestic demand requires much larger than can be met from the output of the Nord and Pas-de-Calais. All sorts of industrial coals are the object of a good demand, as pottery gas coals, steam nuts and washed smalls. In some cases, inferior coals—those easily procurable—are mixed with coals of a better quality.

Coking steam coals become scarcer and the recent starving of several coke ovens batteries in the Pas-de-Calais has more than absorbed the available supplies.

French miners are starting an agitation for an increase of wages. The French National Federation of Miners has just written to the Minister of Labor, asking for a raise of wages based upon the increase in living costs and the recent improvement in the French mining industry from the point of view of financial results.

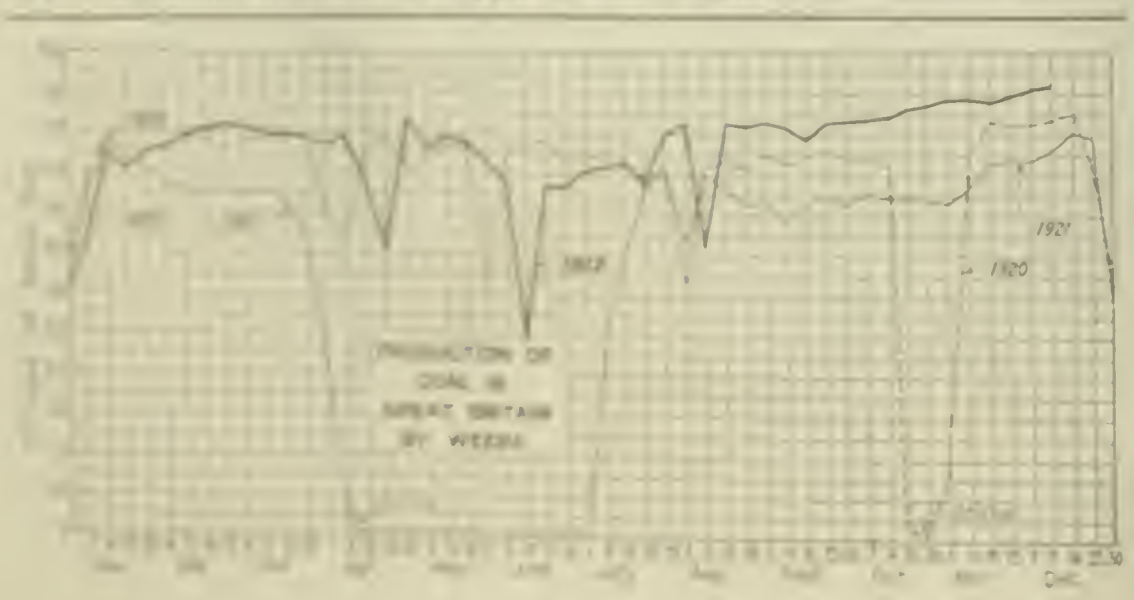
Tonnage waiting	16,493	3,320

Scattered Supplies Boost Roads Price

Increasing car shortage, with consequent diminishing supplies, featured the market last week. This condition occasioned a stiff advance in prices, and inquiries were received on a scale which had not obtained for several months. Supplies were so scattered, however, that little business was being done.

Total coal dumped at Hampton Roads during 1922 was 14,800,880 tons, with the last ten days in December estimated. The dumpings for 1921 amounted to 17,246,848 tons.



Germany Would Cut Coal Imports

It had been expected that the depreciation of the mark and the slightly declining employment of industry would materially reduce the coal import during October. Such hopes, however, have been only partly fulfilled. The total imports were 2,295,371 tons and exceeded the preceding month on account of the increased supply from Polish Upper Silesia. Only the most expensive coal, from Great Britain, declined. These were 918,598 tons in October, or 142,203 tons less than in the preceding month, but still 82,000 tons more than in the corresponding month of 1913.

Approximately 1,500,000 tons were delivered to the Reparation Commission during October. Also, 203,321 tons of German coal were exported.

The output of the Ruhr Valley for November is estimated at 8,600,000 tons for twenty-four working days, as compared with 7,800,000 tons for the same number of days in November of last year. The daily production in the Ruhr was the highest shown in available statistics, at least since April, 1921, the average last month being 356,000 tons, as compared with 339,505 in October.

The increase is attributed to the greater amount of overtime labor and the use of large working shifts. The daily production in October, 1913, was 366,484 tons.

Market Rises Rapidly; Better Grades Scarcer

Many Firms Withdraw Quotations—Intermediates Advance Steadily—"Anything Black" Sells Readily—Future Trading Light—Strong Call for Domestic Soft Coal.

The market moved upward very rapidly last week. Better grades are well sold and many houses have withdrawn their quotations. This has caused a growing scarcity and the intermediates are steadily advancing. "Coal is coal" in Baltimore, New York and other large centers and "anything black" is fast finding a quick market. Buyers are seeking price indications for January delivery, but future trading is rather light and uncertain.

Domestic soft coal is in strong call as a substitute for anthracite. There is already a scarcity of the screened sizes, shippers being unable to meet the sudden demand. Some orders for British coal for January delivery have been closed.

BALTIMORE

Very little coal is coming in, the railroads having fallen down miserably in the matter of supplying empties to the mines, and the demand has advanced by leaps and bounds. The larger consumers of this section were particularly active in trying to get coal the past week and few secured as much as they sought. Some of the smaller industries too are almost without coal.

The best grades of steam coal are practically off the market. The scarcity of intermediate coals is such that when offered they are gobbled up at $5. The market is one in which anything black can be sold. Gas coal is equally as tight as to scarcity.

While there are no importations of English coal here at present, the sharply advancing market of the past week or two gave a ready demand at high prices for some of the Welsh product that was stored near Baltimore. The lump from this pocket, in view of the scarcity of anthracite, has sold to retail dealers up to $14.

NEW YORK

The market moved rapidly last week. Business picked up and the recent loss in prices was more than made up. There is a constant demand for the better grades and when they cannot be obtained buyers fall back on the lower grades, which with increasing scarcity have steadily advanced in prices.

Many operators are refusing further orders and in some instances quotations have been withdrawn. With the holiday season at hand during which most of the mines will be idle for a couple of days at least, it is expected that the railroads will be able to clear their roads and that when the mines do resume operations there will be plenty of empties for at least a few days.

The using of bituminous coal as a substitute for anthracite has added considerable to the present demand. It is being used heavily in apartment and other dwellings in New York. Screened coals are in active demand, shippers not being able to meet the call.

There is a report here that agents are busy placing orders for British coal to help out on the anthracite shortage. Arrivals of foreign coal here during the past week were negligible. It is understood however, that several orders have been closed for January shipments, some of which have been placed by public utility corporations.

Coke is in heavy demand, some dealers having difficulty in supplying call for it. Run of oven coke was quoted around $7.50, and prepared, $10@$10.25.

CENTRAL PENNSYLVANIA

Operators and miners are having a hard time making both ends meet in the midst of the great demand for coal. Operators, generally, are working but one or two days a week and miners are not making a living. As a result of the acute car shortage, producers are not accepting orders as they know they cannot make prompt delivery. Prices are gradually going up.

The situation is said to be aggravated through the storing of large quantities of coal on wheels, as is usually the custom of the railroads at this time of year, in anticipation of severe weather. The Central Pennsylvania Coal Producer's Association is authority for the statement that no relief is expected before March 1. To make matters still worse, considerable coal is being thrown on the market by the Bethlehem, Cambria, and other large steel companies with operations in the district.

PHILADELPHIA

Consumers are now considerably stirred by the slow deliveries and have come into the market very strongly for additional supplies. No doubt much of this anxiety is occasioned by the usual slowing down of production due to the holiday season. Many of those who have been buying from hand to mouth are once more bidding for coal and stiffening prices to just that extent.

The demand for soft coal in the Eastern domestic market grows, the one great difficulty being to make shipments. Shippers of the better class coals feel confident that their product having already made good there will be able to retain some of this trade even during normal times. This seems particularly likely among the larger consumers of domestic coal such as apartment houses and hotels. There has also been developed a good domestic market on coke. Practically all by-product coke is well sold in advance and as a result much Connellsville coke is being shipped.

Prices on soft coal of all grades has materially strengthened and at times the quotations on Pools 1, 2 and 10 are so closely grouped as to show little difference, depending on the eagerness of the purchaser for immediate deliveries.

FAIRMONT

Heavier demands have been made upon the mines as a result of more active buying in Eastern markets, to be attributed in part at least to the substitution of bituminous coal for anthracite in some sections. Mines are still greatly handicapped by a car shortage though production is on a larger scale in the northern part of the district. Mines leading railroad fuel sections receive the bulk of the car supply.

UPPER POTOMAC

Though the strike still continued in the Georges Creek field with Lonaconing the stronghold of the men remaining out, yet it is gradually disintegrating and at Frostburg and other points mines are able to increase their production. Upper Potomac production is not on quite so large a scale as it was about the middle of November. The demand has picked up somewhat. Pool 18 is bringing $2.25@$2.50 and Pool 11, $2.50@$3.

West

KANSAS CITY

Three firms which did not announce an increase in the price of Kansas coal Dec. 14 fell in line the following Monday. Since Dec. 18 all Kansas City dealers have been quoting Kansas lump and nut 50c. higher, and mine run 25c. higher than the season's low prices, established Oct. 23.

The demand, which was more or less revived by the threat of cold weather the first of last week and the latter part of the preceding week, took another slump when the mercury again shot upward.

SALT LAKE CITY

Retail business is good locally as a result of the colder weather. There is a big run on lump, but smaller sizes are expected to move faster soon. The car supply is satisfactory. Mines are working about four days a week which is all the market will stand.

Canada

TORONTO

Owing to severe weather the demand for anthracite is greatly increased. Only small quantities are being received and where orders have been taken for [illegible] have been greatly delayed. Many householders are using soft coal or coke. The rule has been generally adopted by the dealers that 75 per cent of the coal purchased must be hard coal, and this percentage will probably be increased.

There is no change of importance in quotations, which are as follows: Retail steam lump, $11.25; domestic lump, $12.50. Wholesale [illegible] cars at destination, lump, $8.50@$9.00; Pennsylvania soft coal, $4.75.

Anthracite

Scramble for Domestic Raises Independent Prices

Action of Spree Halts Bidding Up by Canadian Buyers—Retail Stocks Low—Substitutes in Demand at Mounting Prices—Smaller Sizes in Good Position.

The domestic shortage increased further last week and the meager supply caused a scramble for tonnage which has raised independent quotations. Canadian buyers, who have been bidding the market up, have received a setback in the warning of Federal Fuel Administrator Spens that this movement must be discontinued, temporarily at least, because of the shortage in the United States.

Retail stocks are very low. Many yards are almost out of substitutes. Bituminous coal, coke and anthracite buckwheat are in strong demand and prices have mounted. The smaller steam sizes are now in good position and little if any are being sold below company schedules. River coals may show stronger because of the strengthening steam prices.

NEW YORK

With the opening of forty-nine "preferred cars" allotted to various parts of Greater New York those users of the domestic sizes who buy in small lots are being largely supplied. It is, however, apparent judging from the way the buyers are to obtain stations that the need of coal is not as acute as it has been reported. Contrary to expectations there was not the rush expected, but there was heavy buying. The coal distributed to the public stations is being sold at the per ton rate.

The companies and larger independents are permitting their coal among their regular customers and are being urged by large shippers. Supply is entirely too small to meet the demand. The supply of substitutes is growing smaller, while those users of the domestic sizes who always put in enough coal to last them well through after the New Year are now realizing that they will have to resort in the way of substitutes when their present supply is exhausted.

The weather, which did almost a complete about face with closing in the last of January, is proving severe. Atmospheric conditions in this section caused the mercury to fall to the zero mark, first in the season of the year.

BOSTON

The retail trade is nearly exhausting its hard-coal supplies with almost all its sales. From the largest distributing yards only occasional cars are delivered to keep the dealers' shelves from being entirely empty. The unfavorable weather during the week has very much interfered with street movement and the coal has moved to a critical time in anthracite.

The evils of recent interference with car supply on certain of the hard coal roads is beginning to be apparent to all. One of the great arteries of supply to this territory is the water route from Philadelphia, and already there are signs that service via this route will be crippled through insistence that cars be sent all-rail.

BUFFALO

The only encouragement is that when the Lakes closed the amount turned in for city use came up till the emergency orders are now about all filled. If the receipts continue the feeling will soon be quite easy, though nobody looks for an adequate supply till the winter begins to go.

At the same time the independent price runs up, some mines refusing to sell for less than $14.50, to which must be added at least $3.28 for freight and perhaps $2 more for carting. If the dealer gets anything the consumer must pay $20 or more a ton.

The Lake trade closed on Dec. 15 with the loading of the steamer A. B. Wolfe for Milwaukee. The amount loaded is 1,070,680 tons for the season. A big effort was made to continue the movement later and 123,630 tons was loaded in December, which is the largest amount for a long time. The shipments for the season of 1921 were 3,810,315 tons. This leaves nearly 2,700,000 tons for the upper district to make up.

PHILADELPHIA

The market continues to be short and there is something akin to a scramble on the part of the consumer to get coal. The shippers claim that their shipments to the city are fully up to the allotments based on a production of seven months.

Natural winter weather still prevails and therefore the consumption of fuel is heavy. Certainly the situation would not have been met as well as it has been if not for the growing use of soft coal and coke. Unfortunately, the deliveries of soft coal are very much delayed, but the movement of coke seems better for some reason and almost every dealer is now carrying both fuels in stock. Coke prices are running $11.50@$13 per net ton.

On such shipments of anthracite as are received the trade is experiencing much trouble with shortages. Most every car received shows evidence of having been robbed, and when complaint is made a considerable delay in securing copies until the railroad can research.

Buckwheat has even grown stronger in demand than last week and spot prices run all the way from comparatively $4 up to $5; in fact many dealers who delayed purchases of this size would gladly pay the latter figure to get the coal. Much of the slack has been taken up in rice and barley and it is doubtful if any of this size can now be bought below $3 and $3 respectively. Under these conditions it seems likely that free coal will soon be offered on the market again.

BALTIMORE

Many yards were left without supplies to distribute. Household burning of soft coal and even wood is on the increase. The Maryland Fuel Distribution Commission charges that Baltimore's share under the allotment promised through the Pennsylvania committee is not being delivered.

The following figures are given out by the local commission on the shipments to Baltimore since the arrangement began in mid-September, the receipts being for the week ending on the days given: Sept. 23, 15,889 tons; Sept. 30, 12,123 tons; Oct. 7, 10,176 tons; Oct. 14, 13,722 tons; Oct. 21, 11,940 tons; Oct. 28, 11,862 tons; Nov. 4, 6,796 tons; Nov. 11, 13,536 tons; Nov. 18, 12,839 tons; Nov. 25, 13,509 tons; Dec. 2, 13,425 tons. The entire allotment for the period from Sept. 1, 1922 to March 23, 1923 is 365,691 tons.

A situation which faced the trade here during the past week was that a number of smaller yards who supply coal to the poorer sections had neither hard nor soft coal to dispose of. In this emergency the city provided Welsh coal at three of its storage yards and disposed of this fuel at 65c. a bushel.

South

BIRMINGHAM

Demand in the spot market is easy, consumers in general continuing to buy scantily and only to meet current needs. The railroads are the only interests which have bought any extra coal for stocking and use during the balance of the year, supplementing contract deliveries, which have been somewhat in arrears due to car shortage.

The last few days of cool weather has strengthened the domestic market to some extent though inquiry is not very insistent, considering the season and the fact that little or no stocks are carried on yards in the territory. Consumers buy a ton or two at a time as weather conditions necessitate, a vast number of householders having stocked no winter supply. Spot and contract requirements about equal the production and there is no surplus coal of either grade.

Although inquiry is comparatively light this condition has not served to weaken prices and quotations have been practically stable for the last several weeks, the minimum for mine run being $2.50. The general price range is the same as shown in our last report.

Car supply has shown no improvement with the exception of the Southern, which is now giving some better service and mines served by it have been operating more regularly. The situation on the Frisco and L. & N. is reported unimproved.

VIRGINIA

Transportation conditions are somewhat more conducive to a larger production though the increase has been small. In view of general market conditions and a stiffer demand in the East a larger production would be possible. Some mines, in order to avoid a suspension when empties are not available, are utilizing their product in the making of coke so that coke production continues at about 14,000 tons a week.

Chicago and Midwest

Market Freshens Over Entire Midwest Region

Run of Cold Quickly Exhausts Dealers' Supplies — Even Steam Consumers Buy Now—Prices Stiffen Noticeably and Transportation Weakens.

The whole Midwest experienced a real stimulation of the coal market during the past week. All signs of sagging disappeared after the run of zero weather began to make itself felt. Dealers who thought they were stocked against a month's trade, sold their yards empty so swiftly that a near-rush for all sorts of domestic coal started. It could not be satisfied because the cold had the simultaneous effect of hampering railroads. This got big steam and gas coal consumers worked up and they, too, leaped nimbly into the trading. Naturally prices started upward.

In some cases domestic lump hiked as much as 75c. a ton though the big companies in the southern Illinois field maintained their circular of $5.50 with a good deal of conscientiousness. Steam coals executed various upward leaps. Screenings got so scarce from one or two of the best-known fields that the producers were unable to fill more than half their contract requirements and boosted their screenings prices ridiculously in order to discourage spot buyers. Even this did not stop orders from men who were solemnly assured they could not expect deliveries quicker than the middle of January.

CHICAGO

The general stir in this market caused by cold weather had exactly the effect that wise observers prophesied some weeks ago. First the winter throttled down railroad motive power, thus reducing car supply to mines. Simultaneously it brought dealers and a large number of medium-size consumers dashing into the market for coal, demanding shipments instantly and generally upsetting things. Naturally, with a smaller flow of coal than previously was available, prices stiffened. Practically all southern Illinois lump is now bringing the top at $5.50; central Illinois hopped from an average of $4 to $4.50 and other coals followed suit. Screenings bounded upward 50c. and even $1 in some instances, for the "considerable stocks" theoretically on hand at big steam plants seemed exhausted. Even gas concerns were caught short.

Domestic sizes were in such demand that every shipper sold everything with ease and producers of the highest grade coals refused orders. Very little Pocahontas coal of any size is reaching here, and, although one shipper with excellent rail connections has been moving a good deal of anthracite here, yet many a householder has turned to soft coal for the first time in his life, thus expanding, as never before, the demand for Illinois and Indiana lump and egg. This, on top of car supply averaging only 60 per cent in central Illinois, 70 in Indiana and 25 to 30 in southern Illinois, is enough to push domestic prices upward distinctly.

ST. LOUIS

Colder weather has kept up the domestic demand in small quantities for the cheaper grades in the city proper and has stimulated business to some extent in the surrounding territory. Steam coal in wagonloads is in good demand in St. Louis. Carload shipments are just about even with the supply. A little anthracite is coming in but no smokeless coals. Some coke is available and is finding a ready market. Steam business outside the city is slow. With continued cold weather business ought to be in pretty good shape within a week.

WESTERN KENTUCKY

Transportation has let down badly the past few days, especially in this field, where car supply as a whole has been fair for some weeks past. Up to Dec. 16 supply had been 20 per cent on the L. & N. lines, and 30 per cent on the Illinois Central but it is claimed that the week of Dec. 19, has shown the poorest car supply in weeks, there having been very few cars on Monday, Tuesday or Wednesday.

This poor car supply along with demand on account of cold weather, and in view of the usual reduction of production over the holidays, is resulting in higher prices. Lump coal recently selling at $3.50@$4, is $4.25@$5. Mine run which was selling at $2@$2.50, is now $3.25@$3.50 and screenings at $2.50@$3.00, with some holders asking $2.75@$3, as supplies are scarce and demand good. Indications are for a stiffer market until the middle of January, with prices after that time largely a question of transportation and weather conditions.

LOUISVILLE

Car supply in Kentucky was quite poor during the week ended Dec. 18, while demand due to colder weather and a desire to stock over the holidays, is resulting in prices advancing, as there is not much coal uncontracted. Prices are largely a question of how badly the buyer wants it, and how many bids the seller is receiving. Trading is in car numbers again.

Railroad consumption is better, while retail demand is much better, and there is a fair demand from gas plants, public utilities, industries and the general lot. While buying is not heavy it is for short-time use, with the general belief on the part of buyers that any advances will be but temporary.

Jobbers and producers are of the opinion that there may be better production during the holidays than usual due to the fact that many miners have been working on such short time that they won't be as willing to take holidays as is usually the case. With cold weather and reduced production, indications point to fairly stiff prices for the next two or three weeks or until the middle or latter part of January. It is claimed that the local market is not as strong in price as Nashville and Indiana points on the same basis. Screenings are scarce and in demand at higher prices. Mine run is only in fair demand.

SOUTHERN ILLINOIS

Colder weather brought increased activity in all sizes. What was a surplus last week is a shortage this week. There is a good demand for everything. Even steam coal moved up in demand. Railroad tonnage shows increases in the Carterville district. Coal from this field is firm at $4@$4.50 on domestic sizes, and moved up to $4 on screenings.

Car supply is unusually bad. The Illinois Central averages but a little better than one day a week. The Missouri Pacific is in bad shape and even the Burlington is not maintaining its standard. The movement of both coal and empties is poor. Similar conditions prevail in the Duquoin field where the Illinois Central car supply has seriously crippled the tonnage.

Movement from the Mt. Olive field would be good if cars were available, but between poor railroad management and short-sightedness on the part of operators the tonnage has diminished except on some steam sizes which are a little bit hard to move. Prices for domestic sizes for the week ended Dec. 23 are $5@$5.50 and $4.50 for the industrial trade, with steam nut and screenings at $3@$3.50.

In the Standard district car shortage has put a crimp in everything. The Illinois Central has plenty cars to move the Louisville & Nashville a fair share and the Pennsylvania is in pretty sharp now that it has been for many months. There is a good demand for all sizes of standard coal except steam nut which is a little slow. Screenings are worth $1.50. Tonnage has moved up to $3@$3.25, while the busy L. & N. is $4@$4.75. Some coal and coke moved to Evansville. Electrical tonnage is good but operators for week during the holidays do not contemplate.

INDIANAPOLIS

Weather [illegible] past two weeks for three days. The first part of the last week did a lot for the coal business both domestic and industrial demand lengthened out, though there was no appreciable change in prices except [illegible] advances on some domestic grades. The [illegible] has been a growing scarcity of Pocahontas in the territory. Some wholesale dealers reported deliveries were very slow on all grades of Kentucky and West Virginia coal. Many Indianapolis operators reported [illegible] to contract out of some grades. However, there has been nothing that might be called a shortage.

The increasing use of Indiana coal for domestic purposes is quite noticeable. While there has been a slight increase in demand from the industrials there is not enough in the fact that they are active at any moment, but to a normal consumption in production.

Eastern Inland

All Grades Show Strength. Storms Cripple Railroads

Retail Yards Getting Buyer and Orders Coming—Pocahontas Grades Scarce—Industrials Insist on Quick Delivery—Sizable Premiums Obtained for Prompt Coal.

All grades of coal have strengthened with the colder weather. The car shortage is most acute and motive power has been dealt a hard blow by the severe storms of the last two weeks.

The slow car movement has drained the retail yards and replacement orders are coming in volume daily. Pocahontas grades are very scarce. Industrial buyers, alarmed at meager offerings and slow receipts, have entered the market insisting on quick delivery. This buying of car numbers has boosted the market to such a point that a considerable price differential exists between prompt coal and tonnage that users are willing to buy before it is loaded.

CLEVELAND

A [illegible] shortage of domestic coal is cut as a probability as retail yards find shipments from the mines held up by the severe car shortage. Public utilities have been making [illegible] purchases, and irregular buying is being done by the iron and steel plants. Industrial operations remain surprisingly broad for this time of the year. The usual slowing down of big enterprises for inventories is relatively small, especially operations of iron and steel, automobile manufacturers and building.

The steel mills have been stocking coal and most of them now have fairly large supplies. Little price softening has resulted from the absorption of Great Lakes tonnage. Some softening of quotations on West Virginia coal has developed within the last few days. Eastern Ohio steam also has advanced about 50c.

Difficulty has been found by coal dealers in getting domestic consumers to substitute anthracite coal for Pocahontas, which users have been accustomed to burning. Gradually, however, domestic users are placing orders for anthracite coal as they realize the difficulty of getting coal from West Virginia because of the railroad situation.

DETROIT

There is some buying being done, but it is apparently in an irregular way and without regard to the desirability of accumulating reserves. The orders coming from industrial plants are of small proportions and seem to be an effort to provide for present needs without regard to requirements [illegible] many days in the future.

Instead of the shipments to Detroit increasing in bulk with the close of Lake navigation jobbers report that there is apparently a reduction in receipts, which results from the transfer of cars to other lines of business and is brought about also by lowered efficiency of transportation facilities in the extremely cold weather recently prevailing. Embargoes on various coal-handling roads, also, are a factor in cutting down receipts.

Hocking lump is quoted at $5.50, with a freight charge of $2.18 to be added; mine run, $3, and nut, pea and slack, $2.50. With the same freight charge, Pittsburgh No. 8, lump is offered at $4.25; mine run, $3.25; slack, about $2.

EASTERN OHIO

Due to the most acute car shortage of the past year, this district produced only a minimum tonnage during the week ended Dec. 16. Output was 288,000 tons, or about 45 per cent of the present rated capacity, registering a decrease under the preceding week of 60,000 tons.

It is reported that on the B. & O. there were no cars whatever available for loading commercial coal during half of the week, and that transportation conditions on the other roads were not much better. Heavy snow storms during the week, coupled with lowering temperatures, apparently had disastrous effect upon the inadequate motive power of the roads. Another factor also contributing to transportation disability is that since the close of Lake navigation the mines are loading coal to more distant destinations thereby necessitating a greater transportation service. Congestion of the Toledo gateway and paralysis of rail movement in the lower Michigan peninsula due to the severe weather also affected adversely the car supply at Ohio mines.

Despite restricted mining operations generally, Cleveland industries and retail yards during the week ended Dec. 16 received the largest quantity of bituminous coal on record. Total arrivals were 3,050 cars, 2,270 for industries and 780 for retail yards. Since Oct. 1 weekly receipts now average 2,240 cars, compared with 1,512 cars per week during first quarter, 1,022 during the second and an average of 791 cars per week for the third quarter of 1922.

In the Lake trade, a new mark was made for shipments from Sept. 1 to the end of the season when 13,350,794 tons were loaded, the year 1917 being nearest to approaching these figures with 12,502,772 tons.

COLUMBUS

With colder weather prevailing, all grades have strengthened materially. Buying for all purposes is active and with a still further decline in the car supply, higher prices are prevailing in every mining district.

Retail stocks are fairly good although the country territory reports low stocks in many communities. The low pressure of natural gas is causing a rush of domestic orders. Some advances have been reported.

Steam buying is now more general. Railroads are taking a good tonnage and the same is true of utilities and other large consumers. Manufacturers are now looking around to increase their reserves in view of a still further car shortage.

An embargo on shipments out of Toledo into Detroit was declared on all roads except the New York Central Lines and other embargoes are holding up shipments. A good deal of interruption in railroad service is also expected during the holiday week.

PITTSBURGH

Prices, which had become firm a week ago, have advanced sharply, partly from operators finding they were getting in arrears with their orders, and offering less coal in the market, and partly from the development of a considerable demand from the East. Relaxation of the distribution regulations on the railroads has facilitated the development of this Eastern demand.

Pittsburgh steam coal, which stood at $2.50@$2.75 a week ago, is now strong at $3@$3.25. Gas mine run, which was nearer $3 than $3.25, is rather strong at $3.25@$3.50. Domestic 1¼-in. lump remains at $4.50@$5 as the general market.

There has been a special call from the East for nut coal, but very little is offered, on account of car conditions. Car shortage has made it that the average mine does not wish to screen at all, as there must be three or four cars in hand at one moment. There has been, in fact, what amounts to an extra price for screening, in that slack, nut and lump, sold individually, bring considerably more than the same coal would bring when sold simply as mine run. Domestic coal is necessarily sold over a 1¼-in. screen, and what is left has been going largely as slack, while to produce nut would subdivide the screening operation farther.

BUFFALO

A few of the shippers claim to see a stir in the bituminous trade, but others say that it is at the best only temporary and some do not see any improvement. It is true that cars are scarce and the demand is a little better.

The slow movement of cars hampers the jobber, who does not dare to promise anything and does not often venture to buy coal unless it is already sold. A price that has not changed much lately is about the only favorable condition. The consumer still looks for lower prices.

Prices have not changed materially for several weeks. The rule has been a gradual weakening without much decline. Present quotations: $4.75@$5 for Youghiogheny gas lump; $4@$4.25 for Pittsburgh and No. 8 steam lump; $3.10@$3.35 for Allegheny Valley and other mine run and $2.75@$3 for slack. A little Pennsylvania smokeless is selling at about 25c. over the other.

NORTHERN PANHANDLE

Mines are finding a better market in the North than in the West, owing to a shifting of market conditions, and at the same time are experiencing less difficulty in making Northern shipments, owing to embargoes against the movement of anything but railroad fuel to some Western points.

Northwest

Brisk Weather Runs Up Market on All Grades

Screenings in Such Good Demand Again That Southern Illinois Brings $3—Lake Season Closes with Only Third Enough Anthracite In.

Winter for 10 days has proven that the strange coal market in the Northwest this fall has been largely a weather proposition. The strong rush on docks and rail shippers about the second day of the cold spell firmed up every price quoted on all coals, raised southern Illinois screenings to $3 in spots and restored lump from that field to $5.50.

The close of the Lake shipping season shows that only one-third of the normal volume of anthracite has arrived and that little over half the ordinary amount of total shipments were made. The grand totals were not all in at the end of the week. Anthracite on hand will be exhausted soon after Jan. 1 without much assurance of hard coal by rail. An advance in freight rates by boat to Duluth added 75c. a ton to Lake anthracite there.

MINNEAPOLIS

After a long mild fall and early winter, some real Minnesota winter descended upon this section. As a result, the local market which has been completely demoralized on screenings, has picked up notably. Prices have advanced sharply and various grades of Illinois screenings are now selling up as high as $3 at the mine, with orders 30 days behind. Central Illinois screenings are $1.65@$1.85. Prepared sizes range from $5.50 for the southern Illinois down to $3.50@$3.75 for central Illinois. All available coal finds a ready market. The docks are sharing in the strengthened situation. Dock coal is worth $9.50 firm for Youghiogheny and $9.25 for Hocking.

The hard coal situation is distressing. The season's receipts were about 560,000 tons—against about 1,800,000 tons for the season of 1921. Deducting the 400,000-ton carry-over, leaves a consumption for 1921-22 season of 1,400,000 tons. Counting the carry-over into this year's total there are only 960,000 tons for the 1922-23 season.

Already dock stocks are down to about 100,000 tons, and the heaviest of the winter consumption is still to come. A number of points have reported being entirely out of hard coal and in dire need of it. The stock on hand will be exhausted soon after the New Year. The fuel commissioner has been working for some time to get all-rail shipments to supplement the Lake receipts but without definite hope of success. So far as hard coal is concerned, the various promises and near-promises made, have been but a harmless poultice to allay irritation.

DULUTH

Hard coal, or what there is of it on the docks here has been advanced in price 75c. a ton. This is not because of the shortness of supply but rather because of the advance in Lake freight rates during the last week of navigation when the majority of the coal now for sale arrived. Egg is now selling at $13.25, stove at $13.65, nut at $13.50, pea at $11.75, buckwheat at $8.50, and anthracite dust at $4.

In view of the fact that substitutes are not proving satisfactory for use in base burners, coal men have decided to reserve what stocks are available here for use in those houses which are not supplied with furnaces.

Dealers here claim that consumers of hard coal are better off than in any other part of the country, because of the stocks which were on docks at the opening of navigation. It is claimed that many of the orders which were listed are being withdrawn, and that consumers had listed their orders with several different companies in the hope of getting coal from one.

Official figures showing coal receipts at this port for December and for the entire year have been made public. During this month 107,042 tons of hard coal arrived here and 195,247 tons of bituminous. A comparison of this year's receipts with last year's follows:

Year	Tons	Tons	Tons
1922	5,136,334	344,687	21,474
1921	8,319,197	1,044,612	

MILWAUKEE

Weather conditions necessitating maximum fuel consumption are responsible for a lively coal market. Local delivery systems are taxed to the utmost, and shipments to the country are as liberal as the railroad conditions will admit. Prices have not been advanced, however.

Following investigation of a charge made at Oshkosh, Wis., that Milwaukee coal dealers were profiteering, Paul Prescentin, state fuel administrator, advised the complainants to do business only with brokers subject to regulation by the coal administrator. He reports that responsible Milwaukee dealers are not charging excessive prices nor have they disregarded restrictions imposed by the state coal authorities. Less than 20 per cent of the coal sold at Milwaukee is from independent producers, which means that the price on the other 75 per cent will remain stationary.

Thirteen cargoes of anthracite and seven cargoes of soft coal represent December's coal quota by Lake. The hard coal approximates 87,000 tons and the soft coal 53,000 tons. Car-ferries brought considerable coal in December but the figures are unobtainable yet.

New England

Buying in Small Tonnages; Prices Continue to Harden

Inquiry Far from Brisk—Scarcity in High-Grade Low Volatile for Spot Shipment — Railroad and Industrial Reserves Tend to Prevent Price Ascent.

The current market shows a further hardening of prices. Inquiry is by no means brisk, and purchases thus far are only for small tonnages, and the volume of high grade low volatile available for spot shipment is undeniably meager. Ample reserves for the present on the part both of railroads and the larger industries are the chief factor in keeping prices from soaring, for it would need but a few comprehensive orders to give the market a decided push upward.

Medium grades of low volatile originating in central Pennsylvania have sold as high as $5.25 per net ton at the mines, the same coal having sold but a few weeks ago at not over $3.75.

As at present advised, buyers are extremely reluctant to buy in advance of actual need. Most contractors have been making deliveries reasonably well, and that has a bearing on the spot market. Offerings of Southern coals are extremely light both at the leading piers and at rehandling points like Providence, Boston, or Portland. December quotas of Pocahontas and New River have been forward and few of the local consignees are as yet short of current supply.

There have been frequent delays recently in clearing coastwise transportation. Short car supply for east-bound movement is having its influence, but doubtless the chief factor is the attractive Western market for prepared coal. Certain of the agencies are pushing for deliveries on large contracts in that territory, however, and the Hampton Roads situation cannot be said to be so closely restricted as might appear.

For inland delivery from rehandling wharves at Ohio and there has been a marked appreciation of prices. From a $9 level spot quotations have advanced to $10.25@$10.50 per gross ton on cars, due partly to a cold increase in demand.

Movement all-rail has slowed up materially during the past fortnight. Certain of the smaller operators in central Pennsylvania have been kept starved for cars and five days a week and closer there are other complaints from consignees who have coal but there or thereabout upon purchases.

Cincinnati Gateway

Contract Talk Is Heard, Arouses Little Interest

Transportation Difficulties and Colder Weather Bolster Up a Falling Market at a Time When It Was Slipping Badly

Somewhat earlier than usual, but not to be denied is the talk of contracts that can be heard in this area. It would appear that the takers of coal believe that there are sufficient business reasons why it would be advantageous for them to get under cover for three, six, or nine months, and some of them are even willing to make it for a year. Prices, however, are not much in accordance with the ideas of the producers. Generally speaking the prices hinted at are $3.50@$4 for smokeless and $2.75@$3 for bituminous.

Transportation affairs were put to their first real test during the past week and were found wanting. The N. & W. and the L. & N. placed embargoes against everything but coal and laid the blame upon the inability of the connecting lines to clear the congestion at this gateway. The C. & O. was in a bad fix though it was able to keep most of its loads moving. Prices which had been weakening stiffened under this condition.

CINCINNATI

The smokeless market holds to the even tenor of its way. Fewer cars of Ivy Fork and New River prepared coal find their way into the hands of the middlemen so that with this tonnage almost negligible it is useless to quote the prices $3@$4, which are being asked. Circulars from the N. & W. have requested Pocahontas operators to dig as many of their cars coal as possible. The distant supply of smokeless this month has thrown for years is now a matter of record.

Increased buying of high-volatile coals with the cars in a fair supply of the mines brought an advance of 25c. per ton, with the holders of coal on track asking even more. The slowing down in production, due to the holidays also has had its effect in helping to stiffen the coal that has been made.

Other business has not changed materially, colder weather has brought a rush of orders which can only be filled gradually. Steamboat coals sell at $3@$3.25 mine or below for the best, lower at $2.50@$2.75 and slack $2.25.

HIGH-VOLATILE FIELDS

Kanawha

There is some promise for relief from the car shortage since the mines have gone forth to Western roads to furnish the C. & O. an excess number of cars for a period of 20 days in the hope of overcoming the deficiency in the supply. What little spot coal it has been possible to produce has been consigned to Western points, although there has been a growing demand in Eastern markets.

Logan and Thacker

Logan production is not averaging over 25 per cent of capacity. Larger shipments are out of the question in view of existing transportation handicaps. There would be even more idleness if it were not for the fact that so many companies are storing their coal. Producers find it difficult to keep up a regular supply for their customers, especially in view of the slow movement over the Western divisions of the C. & O.

Thacker mines are not shipping more than 40 per cent of their possible output owing to the failure of the N. & W. to furnish anything like adequate transportation facilities. Aside from the railroad fuel required by the N. & W., the bulk of the output is flowing on contract, production being insufficient to provide much free coal for the open market.

Northeastern Kentucky

With a car supply not over 26 per cent, the field is not producing as much as 100,000 tons a week. Even when coal is loaded it is held up at various points. There is a fairly good demand for steam grades and with railroads securing a good tonnage but few companies have any free coal to spare.

LOW-VOLATILE FIELDS

New River and the Gulf

The greatly restricted output in New River territory is to be attributed solely to a miserable car supply afforded by the C. & O. It has been going steadily from bad to worse despite all the management of the road could do. It has been almost out of the question to ship any coal to Western points. Eastern shipments have been stimulated.

Though Gulf production is on a little larger scale, it is nothing to boast of, fluctuating between 100,000 and 110,000 tons a week. It is now possible to secure $5 or better for spot mine run.

Pocahontas and Tug River

Pocahontas production has increased because of improved transportation facilities. The car supply is still irregular, however, preventing mines as a whole from loading more than 50 per cent of potential capacity. The great trouble appears to be with motive power on the N. & W. This road, having better facilities for moving coal to Eastern points, is making every effort to increase that rather than Western traffic. There is now a much better demand for Pocahontas in all grades in Eastern markets.

Tug River mines are also limited in production by the poor car supply. Contract miners alone would absorb more than the present output but it is not even possible to take care of that character of business.

Coke

CONNELLSVILLE

The coke market has been lifted entirely out of its regular channel by the sudden demand that has arisen for coke for domestic fuel in the East. The furnace coke market had gotten down to a point where it was easy to buy very good grades for blast furnace use at $6.50, but day by day there were heavy buying orders from the east, and all floating supplies were absorbed, until $9 was paid on a large lot.

The general market is now quotable at $8.50@$9, and this seems to apply equally to heating, blast furnace and foundry coke. The blast furnaces have been indisposed to pay prices asked, while foundries when quoted the advanced prices have postponed purchases.

Some operators seem indisposed to allow a transient demand to interfere with the regular movement to metallurgical consumers, but these are in the minority. Meanwhile, furnaces that buy at flat prices are uncovered for first quarter and are in no position, on account of prices at which they have sold pig iron, including their sales of foundry iron at $25, valley, for first quarter, to pay current prices for coke. There are practically no negotiations for first quarter contracts and matters will probably drift until the situation becomes clearer. There is a possibility of some furnaces banking.

Estimated production of coke during the week ended Dec. 16, was 208 610 tons, an increase of 5,800 tons as compared with an increase of 9,040 tons during the week preceding.

UNIONTOWN

Orders have come into the coke region from Philadelphia, New York and New England for all available tonnage for domestic use and price does not seem to be a factor. As a result the price has advanced sharply.

The sudden shift of the coke market has practically suspended contract negotiations for 1923 delivery but a few inquiries are out for January business. Ten days ago furnaces would have been able to close for business up to March 31 but now operators are reluctant to commit themselves and it is almost a foregone conclusion that no contracts will be made to extend more than a month at a time.

The coal market also has stiffened, due to cold weather, but also to a great extent to the ever-prevailing car shortage. There were fewer cars placed this week than at any time since the strike ended. Quotations now are $2 75 @$3 for steam and $3@$3.50 for by-product.

BUFFALO

The market is getting to be much influenced by the need of something as a substitute for anthracite. Prices are strong. The byproduct ovens are not able to provide any for domestic use. For the present the supply is very short. The local furnaces are increasing their activity. The local illuminating gas company now makes no gas and so has no coke to sell. It buys its gas of the byproduct ovens and mixes it with natural gas.

News Items From Field and Trade

CONNECTICUT

The Devon Coal & Ice Co., Bridgeport, is a recent incorporation under the laws of Connecticut, to engage in the coal and ice business with a capital stock of $50,000. The men signing the incorporation papers are William B. Boardman, Jonathan Grout and Lawrence J. Eckstrom, all of Bridgeport.

ILLINOIS

E. F. Kuhlman, vice-president of the Keystone Coal & Mining Co., Chicago, recently married Miss Margaret Bales, of La Grange, Ill. The couple left immediately for a week's honeymoon in the East, expecting to visit New York City, Washington and other cities en route.

J. H. Vickers, of the Bitumacite Coal Co., of Chicago, announces that Mt. Vernon has been selected as the location for its plant for the manufacture of bitumacite, a substitute for coal. The first plant will consist of a unit with a capacity of 500 tons of bitumacite per day. The company also plans to make Mt. Vernon the headquarters for the manufacture of its processes and other of its machinery and equipment.

The **Sangamon County Mining Co.,** Springfield, owners of the Latham mine, Latham, and the Citizens mine, Lincoln, as well as various holdings in Springfield and vicinity, have changed the name of their company from the Sangamon Mining Co. to the **Brewerton Coal Co.,** and the capital stock has been increased from $200,000 to $500,000. One reason for changing the name of the company was the fact that there is already existing a Sangamon Coal Co. and considerable confusion through the state resulted.

The Central Illinois Public Service Co., announces that it will soon furnish power for the 12 mines of the Old Ben Coal Corporation in Franklin and Williamson counties. The lines of the power company will be connected with those of the mining concern at West Frankfort and will furnish power for the output annually of approximately 6,000,000 tons of coal and the power bill of the mining company will aggregate nearly half a million dollars each year. The contract signed between the two companies calls for the service for a period of ten years. The Central Illinois company states that this will make a total of about 73 mines being furnished with power from its plant at Harrisburg and other plants located in southern Illinois. The company is at present erecting a large new plant near Grand Tower on the Mississippi River.

The Glen Ridge Coal Mining Co., Chicago has been incorporated, with a capital of $100,000; incorporators: Charles W. Bidwell, Calem S. Fudge, Elmer W. Hebbstreet, A. H. Meas and Arthur W. Kettles.

The Quaker Coal Co., Chicago, has been chartered to mine and deal in coal, etc., capital, 100 shares, no par value. The incorporators are Edward D. Pomeroy, Edward P. Kearns and Henry T. Martin.

The Wolverine Coal & Mining Co. has increased its capital stock from $20,000 to $50,000.

The Trojan Coal Co. has increased its capital stock from $20,000 to $30,000.

E. C. Searles, of Chicago of the Crear-Clinch Coal Co., has returned to his home in that city after visiting coal properties in Williamson County.

Clifford Mine No. 8, Christopher, lost its washer and practically all of the wood work in a recent fire. The loss is estimated at $90,000. The mine is owned by the Consolidated Coal Co., St. Louis, Mo. The mine will be able to resume operations as soon as the screens are replaced and general repairs made.

The West Frankfort office of the Old Ben Coal Corporation is to soon have a telegraph outfit installed for the private use of the company with its main office in Chicago and with its many mines in Franklin County. The plan is expected to save a good deal of money.

INDIANA

The Midwest Fuel Co., Indianapolis, has been chartered to deal in coal, capital $10,000; directors, James W. Costin, Mildred C. Costin and Burrell Wright.

Three men were seriously injured recently in the **Wabash mine** at West Terre Haute, when they were struck by one of the haulage motors. It is said the three men were coming out of the mine with mules and that either there was a misunderstanding of signals or the motor broke away and they were struck before having time to clear the tracks. The mine is owned by the Coal Bluff Mining Co.

Fire recently destroyed the miners' wash house and the blacksmith shop of the **Green Mound Coal Co.** mine seven miles south of Washington, on the Big Four R.R. Work clothes of 135 miners and valuable machinery were burned. There was only insurance. The mine is owned by T. C. Bugg, of Evansville.

The Consumers Co-operating Coal Co. has been organized at Vernon with a capital stock of $50,000 to operate mines and deal in retail selling of coal, cement, lumber and other building materials. The organizers of the company are **W. T. Semon, Otto H. Olfe Jr., and B. H. Smith.**

A shot firer was killed in a dust explosion recently which wrecked the **Mohawk mine,** fourteen miles northwest of Linton. The damage to the mine is estimated at $50,000. The shaft will be out of commission for at least two weeks.

A new tipple is being erected at the **Oates coal mine.** The mine is in Fountain County, a few miles east of Deerville. It is a wagon mine and coal is trucked to Lafayette, Crawfordsville, Attica and Veedersburg. The coal is known as the Bastard Block. This mine is proving to be a successful one and is handling a large volume of coal each week. It is owned by W. M. Vaun, of Newport and William Copas, of Stringtown.

IOWA

The Burlington R.R. will build a siding for the **Pearson Coal Co.,** at Clarinda. The switch will be 700 or 800 ft. long. The new mine of the Pearson Coal Co. is southwest of Clarinda, on the G. W. Snodgrass farm. The switch will extend from the Tarkio branch right of way.

KANSAS

The Carr coal mine, near Leavenworth, was closed down Dec. 8, with the consent of the Kansas Court of Industrial Relations. In its petition to the court the company declared it could not operate at a profit until the cost of mining was decreased or the price of coal increased. In 1921 the mine produced 37,462 tons, representing the output of 143 men working 177 days.

KENTUCKY

The Big Seam Coal Co., Creech, has been chartered with a capital of $10,000, stockholders being C. J. Lewis, J. D. Yarbrough and McKinley York.

The Falls Branch Coal Co. has filed articles of incorporation with the County Clerk at Lawrenceburg for mining and handling coal and timber lands and mines. Capital stock was placed at $75,000. The company will be managed by a board of three directors, consisting of F. Woodruff of Power Valley, Ky.; J. F. Worthington of Worthington, Tenn., and C. F. Woodruff of Louisville.

Organization of the **Hazen Coal Co.,** to exploit 12 West Virginia tracts by the syndicate of owners Kentucky coal lands, has been announced by W. H. Denning, C. P. Merrell and R. J. Edwards. The company is incorporated for $150,000.

The Spring Lick Coal Co., of Murray, Ky., has been incorporated with a capital of $10,000, the incorporators being Thomas W. Hickerson, Miss Viola Mabry, Hickman; Carlos H. Glover and Mrs. Mary A. Glover.

Five of Harrison men are held in Detroit for the death of **L. B. Wiles,** union organizer, shot to death by a mob on the night of Sept. 18, 1921, were released on Nov. 8, as the commonwealth was unable to prove any connection between the men and the crime. Eight others are to be tried. Wiles was shot to death at Holden by an armed party.

The Green River Fuel Co. of Muhlenberg County, Ky., capital $50,000, has been chartered by the incorporators, C. H. Sanders, W. H. Sanders and John B. Bunnell.

The Lester Coal Co. of Middlesboro, capital $5,000, has been chartered by P. L. Smith, W. Dyer, J. F. Bradley and John Howard, of Middlesboro.

The Virginia Supply Co., Harlan, has been chartered by W. B. Lewis, P. H. Neal and Wilson Jones.

The Atlas Coal Co., Louisville, capital $100,000, has been chartered by Lee Hogan, P. H. Neal and Wilson Jones.

Articles of incorporation of the **Banner Coal Co.,** Inc., have been filed in Kanawha County, West Virginia, by Thomas C. Hogg, Kenneth Hogg and E. J. Edwards, all of Huntington, W. Va. The company will operate mines in the Elkhorn district.

The State Tax Commission has approved the application of **J. L. Smith,** Louisville, to install a system for the sale of bituminous coal and mineral lands, and it is now in active operation. Three other men will be named later. Chairman Kenney T. Wilson said the 1922 General Assembly appropriated $30,000 annually for two years to be used in securing a survey of the coal and mineral lands of the state so that the Tax Commission could arrive at an equitable assessment.

The West Kentucky Coal Bureau in the near future will try to induce the State Legislature **not to pass a proposed tonnage coal tax.** The bureau considers such a tax would retard business and practically put the mining men out of business. The bureau considers the fact that it is hard enough for miners to make a profit, for the cost of a mine that becomes non-productive is total loss.

MASSACHUSETTS

The Massachusetts Anthracite Co., of Boston, is a recent incorporation whose purpose is to deal in coal, coke, etc. The capital stock is $100,000 and the incorporators are Samuel J. Mansfield, Lewis Cousens, Samuel J. Mansfield, Jr., and Frederick A. Cousens.

MICHIGAN

Coal mining operations have been started on the property of the **Peoples Coal Mining Co.,** Detroit, which has a contract for the entire output of the property for a number of years. The mine was opened by the Peoples Coal Mining Co. in 1919 and operated for a short time, but was then closed down. The mine was reopened recently by the present company.

MINNESOTA

H. E. Hazel, sales agent of the Northwestern Fuel Co., was re-elected president of the Minneapolis Coal Exchange at the annual election held recently.

W. A. Dyment, for a number of years manager of the Minneapolis branch of the Pittsburgh-American Coal Co., has resigned his position with that company to become manager of the Minneapolis branch of the Consolidated Coal Co. of Chicago, and will be succeeded by Mr. Schaefer, who has been assistant manager of the Minneapolis branch.

MISSOURI

The Missouri Lovely Coal Co. has been granted a charter by the Secretary of State to mine coal in Macon County. The capital stock is $10,000 and the incorporators are W. H. Bell, E. L. Bell and Mrs. Mary Bell, all of Macon.

The White Coal & Mining Co., St. Louis, has filed with the Secretary of State articles of incorporation with a capital stock of $50,000. The incorporators are W. H. White, Mrs. A. White and W. H. White, Jr.

NEW YORK

H. D. Matlack has been named general manager of the **Matlack Coal & Iron Co., Inc.**, New York. F. Wilkin has been elected vice-president and G. Wilkin general counsel and treasurer.

Thomas T. Brewster, vice-president and general manager of the Mt. Clare & Staunton Coal Co., is a member of the executive committee and one of the vice-presidents of the **American Institute of Mining and Metallurgical Engineers.** As the official organ of the organization no nominations appear to be accepted by the members, Mr. Brewster's election may be regarded as assured.

OHIO

The Cremer Coal Co., Zanesville, has been incorporated, capital $100,000, incorporators: R. H. Carroll, C. W. Hazell, E. F. O'Dell, H. C. Page and Hazel A. Hinkle.

The Oberlin Coal Co. has been chartered with a capital of $25,000 to deal in coal at wholesale and retail at Canton. Incorporators are: C. E. Oberlin, William H. Quinn, Cora E. Oberlin, Ethel Oberlin and Claude W. Oberlin.

The Lackawanna Coal Co. has been incorporated with a capital of $10,000 to deal in coal at wholesale at Cleveland. Incorporators are: W. F. Maurer, R. Bolon, Thomas Brindle, John F. Wilson and E. C. Dauby.

A deal has been concluded whereby by purchase of the stock of the **Crystal Ice & Fuel Co.**, of Columbus, has been acquired by the **Ohio Ice & Fuel Co.**, of Cleveland. The new owners will make no immediate change in the policy of the management as to the manufacturing and distributing end. William Deer and associates as minority stockholders of the company.

The Supreme Court has handed down a decision in the case brought by the Ohio Fuel Supply Co. to restrain the **Public Utilities Commission** from fixing rates for natural gas. The decision holds that the Commission has no jurisdiction in the matter. The Ohio Fuel Supply Co. is a producing company and sells gas to distributing companies. The Commission has no power to regulate rates except in cases where the gas is sold to consumers direct. The decision will be of importance to the gas companies of the state.

The Peach Knob Coal Co. and the **Knox Coal Co.**, both producing about 50 tons per day, have completed operations. It is expected that other coal companies will follow suit and that many mines will be in operation by the end of the present month.

OKLAHOMA

The Crystal Ice & Fuel Co., of Columbus, has been succeeded by the **Ohio Ice & Fuel Co.**, of Cleveland. The new owners will make no immediate change in the policy of the management as to the manufacturing end. William Deer and associates as minority stockholders of the company.

In a previous decision given recently the Oklahoma Supreme Court held that the **district court** in the same district, by an existing injunction in the Hominy Valley affirmed [illegible] was a public utility and thus comes under the jurisdiction of the **Public Utilities Commission.** Previously the Utilities Commission decided that the following company was a gas seller and thus the Commission had no jurisdiction. The question then has reached the Supreme Court and will be settled by that body. The decision will be of importance to the coal companies of the state.

The capital of the **Tribbey Coal Co.**, Oklahoma, has been increased to the **Midland Coal Sales Co.** (Charles Tribbey, who formed the company about six years ago was drowned with [illegible] when [illegible] Lake Texoma. Mr. Tribbey was [illegible] and was [illegible] years old. He was [illegible] years and has been [illegible] Mrs. Tribbey, who has been appointed [illegible] Tribbey. The development of the mine [illegible] be continued [illegible].

H. C. Kennedy, secretary and manager of the Canadian Coal[illegible] president of the **Kansas-Oklahoma Association**, [illegible] a meeting with the executive committee of the association [illegible] Kansas City [illegible] of the association [illegible] with the [illegible].

PENNSYLVANIA

A strike of 1,400 men at the Lehigh Coal & Navigation Co.'s No. 4 colliery, near Tamaqua, **was called off Dec. 20** when the company agreed to furnish an additional number with the understanding that when the maximum output is reached no request for additional men will be made. A number of the miners walked out Dec. 18, claiming they had been overworked. The strike forced the colliery to close.

H. M. Kanarr, mining engineer, has opened a branch office in the Martin Building, Brookville, with James S. Brett, C. E., in charge as manager.

A charter has been granted to the **South Union Coal Co.**, Greensburg, with an authorized capital stock of $1,000,000. The incorporators are John M. Jamison, Jay C. Jamison and Robert W. Smith, all of Greensburg.

E. C. Brandt, works manager of the Westinghouse-Krantz Works, has been appointed works manager of the new plant now being erected by the Westinghouse Electric & Manufacturing Co. in Homewood, Pittsburgh.

Paul Smolink, fireboss in Franklin Mine 2 of the Cambria Steel Co., Johnstown, met instant death Dec. 20 when a motor which he was operating in the mine crashed into a train of empty coal cars. He was thrown from the motor and the empties buckled up over his body. Smolink was a member of the coal company's mine-rescue squad that rescued the first group of survivors from the Bailly Colliery at Spangler in the disastrous explosion which claimed seventy-seven lives on Nov. 6. He, with ten others of the crew, was awarded a gold watch by the local company in recognition of his service. Smolink's watch, which had been in the engraver's hands, arrived at his home a few hours after he met death in the mine. Smolink was born in Germany, served in the U. S. Army during the World War.

After being worked for 25 years the **Baggaley mine of the H. C. Frick Coke Co. has been abandoned.** Edward Casey hauled the first load of coal from the mine and he was awarded the privilege of bringing up the last trip. The Baggaley employed 100 miners who will be scattered at other Frick operations.

The Pocono Coal Co., Lackawanna County, has notified the State Department at Harrisburg that it has changed its corporate name to the **Clifford Coal Co.**

Two [illegible] agreements for **payment of compensation** growing out of the **mine fatalities at Spangler** have been approved by the State Workmen's Compensation Board. The agreements aggregate $145,650, an average of more than $4,500 in each case. Twenty-nine widows, two fathers, three mothers had eighty-one children under sixteen years of age and who left those upon whom they were dependent are benefited by the agreements.

The decision of the U. S. Supreme Court which held that the Kohler mine-cave act of 1921 is unconstitutional probably will result in a renewed effort on the part of legislators from the Lackawanna County district **to have the state constitution amended.** Delegations from Scranton and surrounding territory explained the need for an amendment before the State Constitutional Revision Commission which drafted a tentative copy of a new constitution for submission to a Constitutional Convention. The people last year voted against a constitutional change but it can be made only by having the succeeding Legislatures pass upon [illegible] before its submission as a question to the voters.

TENNESSEE

George J. Allen, formerly with the Louisville [illegible] office of the Ohio Fuel Co., has been promoted to the Cincinnati office as [illegible] and has transferred to the Cincinnati office as [illegible] sales manager.

UTAH

[illegible] years of the state [illegible] that the average [illegible] is paid [illegible] has [illegible] the only [illegible] in this state under the Public Utilities Commission [illegible] and other [illegible] of fatal [illegible] Twenty-five [illegible] gets result[illegible] difficulty in any case of interfering with the coal men unless the interference is on a national scale. If coal prices here are not satisfactory to the producer he can send his product elsewhere. Especially would this be the case in the event of a general strike in the coal fields of the eastern or the West.

Development of the coal fields of Utah, with an outlet at Los Angeles harbor, has been given impetus through action by the Board of Harbor Commissioners of Los Angeles in approving plans for the establishment of a half million dollar coal bunker on Pier 1 at the port by the Marine Transportation & Fuel Co. Officials of the company state that they will receive coal both by land and sea to supply coal-burning vessels touching at the port. It is reported that the Utah fields would be tapped by the Santa Fe R.R., which would transport the coal to the harbor via its proposed franchise right-of-way extending to the port from its existing tracks between Ingelwood and El Segundo. Los Angeles interests are declared to be back of the proposed development of the Utah coal deposits and it is said that the project will involve the expenditure of approximately $250,000.

VIRGINIA

The first shipments of navy coal contracted for with the **Pocahontas Fuel Co.** for delivery in Norfolk in January, February and March, will arrive at the Naval Operating Base soon after Jan. 1. The navy has bought 100,000 tons at $7.80 gross at the piers. Approximately 200,000 is held in reserve at the Norfolk naval base.

The offices of **Jewett, Bigelow & Brooks,** maintained at Norfolk for a number of years, will be closed Jan. 1. **W. H. Brown,** Norfolk manager for the company, has organized the **W. H. Brown Coal Co.,** and will begin business under that name on the same date and in the same offices. He has not completed arrangements for business connections as yet. Information here is to the effect that the Jewett, Bigelow & Brooks company has obtained a selling agency and that that firm will be dissolved.

WASHINGTON

Major William J. A. Muirhead, who resigned as traffic manager of the Port of Seattle, has accepted the position of vice-president and general manager of the **American-Canadian Coal & Coke Co., Inc.,** which was organized last May and has extensive interests in Alberta. The company will maintain offices in Seattle and Wenatchee.

WEST VIRGINIA

Governors of eleven states, accompanied by their wives, donned jumpers Dec. 15 at Glen White, near Beckley, and descended 250 ft. into the earth to **inspect a coal mine.** All wore the regulation miners' caps with lamps attached. The Governors came from White Sulphur Springs, where they had been attending the fourteenth annual conference of the Governors.

Two hundred and twenty workers at the Jamison No. 8 plant of the Jamison Coal & Coke Co., at Farmington, have gone on strike in violation of the union contract despite orders of union officials and without having any grievance against the company by whom they are all employed. The strike was precipitated by the refusal of the Mayor of Farmington, a member of the union, to pay a fine of $100 assessed against him by the local because he worked as a watchman during the strike, as was permitted under the joint agreement.

The Pinnacle Coal & Coke Co., a large Pennsylvania concern, operating on Campbell's Creek in the Kanawha district, mining coal from the Campbell's Creek seam, is letting contracts for the sinking of a ventilation shaft on the property. Work will be started at once. The Pinnacle mine will be one of the largest operations in this section, as it is planned to produce 1,500 tons of coal daily in the next three months. John T. Williams, is general manager; Robert T. Wilson, assistant general manager, and L. Everett White, superintendent.

The **$2,000,000 coal mine of the Brotherhood of Locomotive Engineers,** on Big Coal River at Seth, Boone County, is to begin operations Jan. 15. The company is known as the Coal River Collieries Co. and its board of directors contains the names of the following brotherhood officials: Warren S. Stone, chairman of the brotherhood; W. B. Prater, vice president; T. C. Songer, general chairman of engineers on the C. & O.; Charles E. Glass, of Hinton, and J. T. Keister, of Peru, Ind.

The Lambert Coal Co., Cadiz, has been chartered with a capital of $100,000 to mine and sell coal. Among the incorporators are Charles H. Stone and Jesse M. Hamilton.

The Clear Creek Coal Co., Cincinnati, has been chartered with a capital of $100,000 to mine and sell coal. Incorporators are: A. Herman, Oscar MacGregor, R. M. Brandt, H. E. Howard and L. N. Osborn, Jr.

By an agreement between attorneys for the state and defendants, the trial of **C. Frank Keeney**, president of District 17, United Mine Workers of America, will take place at **Berkeley Springs**, Morgan County, **Feb. 19**, it has been announced by Attorney A. M. Belcher, representing the prosecution. This date for the trial, it is understood will be formally fixed by Judge John Mitchell Woods, of the Morgan Circuit Court, when the regular term opens at Berkeley Springs, Jan. 2.

The 44 new coal companies organized in West Virginia during the months of October and November had an aggregate capitalization of $4,225,000. There continues to be expansion of the industry notwithstanding advice from Washington to refrain from investing capital in the development of coal lands and notwithstanding the fact that the price of coal has been on the decline. In the months mentioned the following companies were organized: **B. R. & P. Coal Co.**, Fairmont, $50,000; **Winifrede-Hatfield Coal Co.**, Williamson, $50,000; **Radio Fuel Co.**, Morgantown, $50,000; **Miami Co-operative Mining Co.**, Charleston, $125,000; **Best Coal Co.**, Charleston, $50,000; **Superior Block Coal Co.**, Morgantown, $50,000; **Baldwin Pocahontas Coal Co.**, Eria, $400,000; **Morrison Coal Co.**, Charleston, $500,000; **Acme-Eagle Coal Co.**, Huntington, $25,000; **Cora Mining Co.**, Huntington, $200,000; **Indian Hill Coal Co.**, Morgantown, $50,000; **Colgate Coal Co.**, Charleston, $25,000; **Eldee Coal Co.**, Huntington, $100,000; **Bell-Creek By-Product Coal Co.**, $50,000; **Baum Coal Co.**, Lexington, $300,000; **McCartney Coal Co.**, Wheeling, with operations in Ohio, $5,000; **McMechen Coal Co.**, McMechen, with operations in Ohio, $100,000; **Slufer Creek Coal Co.**, Charleston, $100,000; **Balwood Coal Co.**, Glen Jean, $10,000; **Beda Smokeless Coal Co.**, Huntington, $25,000; **Elwill Coal Co.**, Charleston, $2,500; **Petrelli Coal Co.**, Follansbee, $100,000; **Gordon Consolidated Coal Corporation**, Clarksburg, $100,000; **Lubeno Coal Co.**, Wheeling, $50,000; **Emmart Coal Co.**, Charleston, $10,000; **Max Coal & Coke Co.**, Charleston, $25,000; **Fairmont-Pittsburgh Coal & Coke Co.**, $100,000; **Two States Coal Co.**, Morgantown, $50,000; **Talisman Coal Co.**, Morgantown, $10,000; **Alpine Coal Co.**, Charleston, $250,000; **Waugh-Longley Coal Co.**, Williamson, $10,000; **Fenimore Collieries Co.**, Van, $125,000; **Clay County Coal Co.**, Clay, $100,000; **J. D. Boone Coal Co.**, Fayetteville, $300,000; **Brown Coal Co.**, Flemington, $125,000; **Tygart Valley Fuel Co.**, Clarksburg, $100,000; **Wise Pocahontas Coal Co.**, Welch, $50,000; **Jones-Island Creek Mining Co.**, Charleston, $25,000; **W. F. Toney Coal Co.**, Williamson, $25,000; **Midland Smokeless Coal Co.**, Ronceverte, $50,000; **Ralfay New River Collieries Corporation**, Beckley, $287,500; **Ohio County Fuel Co.**, Pittsburgh, Pa., $5,000; **W. A. Coal Company**, Welch, with operations in Kentucky, $10,000; **Helen Coal Mining Co.**, of Cumberland, Md., $50,000.

Robert E. Rightmire, engineer of tests of the Consolidation Coal Co., has recovered from a brief illness and is able to be at his desk again.

Joseph G. Kerns, former treasurer of the Wyatt local of the United Mine Workers of America, was sentenced to serve five years in the state penitentiary at Moundsville by Judge John C. Southern in criminal court today when he entered a plea of guilty to misappropriating funds of the union. Kerns, according to information furnished the authorities, stole about $2,400 from the union and then fled to Oklahoma, where he was arrested on a caplas and brought back to Harrison County for trial.

Spontaneous combustion has caused two serious blazes in storage coal piles in the Logan district, threatening the partial destruction of about 40,000 tons of coal. Fire was discovered in one of the storage piles of about 35,000 tons, stored by the Amherstdale Coal Co., not far from Logan, on Dec. 4. A day later a storage pile of 5,000 tons belonging to the Gay Coal & Coke Co., about one mile from Logan, caught fire. Three shifts of fighters were used in stopping the fire in the storage pile of the Amherstdale company, a large quantity of the coal being hauled away so as to prevent its entire destruction. Approximately 10,000 tons were lost because of the fire.

Seniors of the mining engineer school of the West Virginia university are being trained in mine-rescue and first aid work by **Robert Lilly**, a member of the inspection force of the State Department of Mines. It is stated by Inspector Lilly that there are 218 men enrolled in Mount Hope district in the night mining classes. More than 800 miners in West Virginia are enrolled in night mining classes.

The Best Coal Co. plans to erect a tipple, miners' houses, open a store all in preparation for the mining of coal at a point near the city of Charleston.

Organization of the **Eureka Coal Co.**, with headquarters at Charleston, will make it possible to develop coal land in the Kanawha District. The company has just been chartered with a capital stock of $[illegible]. Leading figures in the new concern are J. T. Lightner, Joseph Norton Simms Sayre and E. B. Dyer, of Charleston, Dell Kendrick of Madison.

It is reported that the **Nuttallburg mine** owned by the Ford interests, **has resumed operations** after a shutdown of a month or more. For a time the owners contemplated abandoning the mine, but it is now understood that an opening will be driven at some point on Keeney's Creek and a tipple built near the new opening. This will obviate the costly long haul to the coal tipple at Nuttallburg.

Increases in the capital stock of the following coal companies have been authorized by the Secretary of State of West Virginia: Shriver Coal Co., from $[illegible] to $600,000; **Ben's Run Coal Co.**, from $50,000 to $75,000; **Opperman Coal Co.**, from $50,000 to $300,000; **Margarette Coal Co.**, from $500,000 to $750,000; **Co-operative Fuel Co.**, from $25,000 to $[illegible]; **Wyatt Coal Sales Co.**, from $[illegible] to $200,000; **Long Branch Coal Co.**, from $150,000 to $500,000. The **Wood Peck Fuel Co.** has reduced its capital stock from $200,000 to $75,000.

The largest single order for electrical mining equipment ever placed by a West Virginia operating company it is believed is that recently made by the **Coal River Collieries Co.**, of which Harry Leaberry is president. Included in this order were eighteen mine locomotives and five substations in every way complete, the cost of the new equipment ordered being in the neighborhood of $150,000. This equipment is to be installed at the new plant of the company in the Coal River field. Part of it will be shipped by Jan. 1. The Coal River Collieries Co. is controlled in large part of the Brotherhood of Locomotive Engineers.

The Eleanor mine of the **Hite Barnes Coal Co.**, on Indian Creek in Monongalia County, has been completely electrified with a view to making electric haulage possible. Among other equipment installed was an eight-ton motor.

The Vanhall Coal Co. has changed its general headquarters from Huntington to Charleston.

Prentice Burlingham, of the **Burlingham Coal Co.** of Cincinnati, with large operations in the Hazard and Harland field, was operated upon Dec. 4 for gallstones. Mr. Burlingham is one of the energetic members of the Cincinnati trade whose activities will be missed.

Traffic News

It is reported that the St. Louis & San Francisco R.R. will extend its tracks from Cassville, Barry County, Mo., to Eureka Springs, Carroll County, Ark., a distance of 20 miles.

It is understood that the Louisville & Nashville R.R. has issued specifications for a new steel bridge across the Kentucky River at Lock No. 4, to replace the present structure, which will be removed to make room for the Kentucky River Dam. The new bridge will be constructed in two sections, which will afford a 300-foot channel for navigation.

By an order entered Dec. 11 in Interstate Commerce Commission Docket No. 1211 the Chesapeake & Ohio Ry. Co. and other carriers were directed to cease and desist from the practice of charging demurrage on coal loaded in cars of the Kanawha & Hocking Coal & Coke Co. at Hocking, Ohio, after the expiration of the free time allowed by the Kanawha & Hocking Coal & Coke Co. tariffs. The commission's order will not affect the demurrage charges which may be collected by the Kanawha & Hocking Coal & Coke Co. on coal loaded in cars of other companies.

Rates on coal from Lake Superior points to Iowa, Wisconsin, Minnesota and North and South Dakota have been advanced by the Interstate Commerce Commission in a decision filed with the Secretary of the Commission, Dec. 11. The increases are from Lake Michigan docks to points in Wisconsin and 5¢ on the subject of coke, made by the C. Reiss Coal Co.

The Chesapeake & Ohio Ry. is opening a passenger ticket office in Ashland, Ky., with the agent who has been connected with the baggageman's office at Huntington in charge. This new office will be of great convenience to all persons in the Big Sandy Basin and Ashland.

The Coal and Coke Committee, Transportation Division, Council of National Defense, is preparing a hearing of the Coal Commission of Kentucky on the application of railroads in Central Kentucky and Southern Kentucky for permission to put into effect increased rates on coal from Louisville & Nashville R.R. points on Lee Junction to New Orleans, La. The hearing will be held in Room 511, Liberty Bldg., N. Y., at 10 A.M., Thursday, Dec. 21.

A reduction in coal rates from Alabama points on the Central of Georgia R.R. to Memphis, Tenn., is proposed by the carrier, which has filed with the Interstate Commerce Commission a tariff providing that the rates shall be given to points in Alabama on the Frisco to Memphis. Coal from the mines affected by the reduction now takes 32 cents per net ton, while the rate to Memphis via the Frisco is $1.07 per net ton.

Obituary

Edward A. Uhrig, president of the Mc-Graw Fuel Co., died in Kansas City, Dec. 12, after a short illness. Mr. Uhrig became a national factor in the coal trade when he organized the operations of all the large mines on Milwaukee docks for the Milwaukee Western Fuel Co. When H. M. Byllesby took the management of the company over in 1917 Mr. Uhrig was retained in the organization and was always given to understand that the Byllesby interests would not interfere with his management. Mr. Uhrig was also president of the Kansas City Fuel Co., the H. M. Byllesby Coal Co., the C. F. Kennedy Co., the F. B. Dyer Coal Co. and Thomas E. Durham & Co. He was a director of the Commercial Trust Co. and the Kansas City Clearing House Association. Funeral services were held Dec. 14 at the Country Club Christian Church, Kansas City, Mo., with interment in Mount Washington Cemetery.

Thomas J. Richards, one of the foremost coking men of Pennsylvania in the days of the boom in Connellsville, Pa., died at his home in Connellsville, Dec. 4, in his 78th year. Born in Swansea, South Wales, June 24, 1845, he came to America in 1865. In 1871 he entered the employ of Dilworth Brothers & Minor on the construction of Rainey Station No. 1. When the Dilworths were succeeded in the Connellsville region by the Frick Coke Co. Mr. Richards became general manager of the company. Mr. Richards was elected president of the Connellsville Coke Operators' Association in 1894 and served in that office for 10 years. He retired from active business in 1904, but remained a director of the Frick Coke Co. until 1918. He was also a director of the Union National Bank, Connellsville, from 1894 to 1918, when he resigned on account of ill health. He served as general manager of the Connellsville Gas Co. from 1886 to 1904, when he retired from the company.

Jordan Sykes, who is said to have been the first Connellsville coal field chief to go over the mines of Greenbrier, W. Va., Dec. 13, in the 69th year of his age. Mr. Sykes was born in Connellsville and began his coking career with the Connellsville Coke Co. in 1870. He was a pioneer in the Pocahontas field, having been one of the first to go there. He was also one of the first to go to Alabama. He was a member of the Masonic order and a prominent Elk. He is survived by a widow, two sons and a daughter.

Rockwell Marbetta, 73 years old, prominent railway and coal and coke operator of Fayette and Westmoreland counties, Pennsylvania, and first mayor of Connellsville, died Dec. 12 at his home in Connellsville.

Fred A. Marsh, general purchasing agent of the Link-Belt Co., died in Chicago on Dec. 14 at the age of 51 years. Mr. Marsh was a member of the Link-Belt organization for over 18 years, was one of the organizers of the Purchasing Agents' Association of Chicago, serving as its first president, and had been for some years a director in the National Association of Purchasing Agents.

William Stephan, 68, who had been in the coal coal business in St. Louis since 1867, died of heart failure on a street car in St. Louis Dec. 8. Born in Germany he came to St. Louis at the age of 19 and 2 years thereafter engaged in the coal business and established one of the most conservative high class coal firms in the city. In past years he represented large tonnages in this market, principally that of the Tuscan Coal Co. in the days before coal was brought in carloads to St. Louis, hauling being done from East St. Louis. Until recently his company engaged extensively in the jobbing business. He recently returned from a six months' trip in Germany and was tendered a banquet by the coal trade. His business for the past few years has been in charge of William Stephan, Jr. and O. H. Stephan. In addition he leaves a widow.

The coal industry lost another of its oldest and most prominent executives in the death of **Jesse M. Overton**, president of the Alabama Fuel & Iron Co., and also executive head of several mining operations in Tennessee, who was instantly killed in a collision between a taxicab in which he was riding and a trolley car at Nashville, Tenn., late Dec. 16. Mr. Overton was prominently identified with financial and civic institutions in Nashville, where he had long resided, and was widely known among business men of the South. He was a brother-in-law of Judge J. M. Dickinson, Secretary of War in Taft's Cabinet. He was 59 years of age.

Federal Fuel Control Notes

C. A. Magrath, chairman of the Federal Advisory Fuel Committee at Ottawa, Can., was informed today by C. E. Spens, Federal Fuel Distributor, that because of the acute shortage of anthracite in this country "there is no immediate prospect, if any at all, of equalizing the deficit existing on Dec. 1 in Canada's allotment," amounting to 15 per cent of last season's imports. Mr. Spens' telegram said he was aware of the fact that since Sept. 11, the date the order ceased, up to the first of December you have received only approximately 10 per cent of the allotment of domestic sizes," but "there are sections in this country that are suffering grievously despite that production is practically at a maximum and demand is constantly increasing. Rationing and compulsory mixing of steam with domestic sizes have been inaugurated in the most populous districts, which have heretofore been accustomed to using only domestic anthracite. Other substitutes are also being employed. We have no information that similar drastic steps have been adopted in Canada."

In reply to a recent letter addressed by Federal Fuel Distributor C. E. Spens to the Pennsylvania Fuel Commission relative to the necessity for a closer preparation of anthracite, Mr. Spens has been informed by Chairman W. O. B. Allen, of the Commission, that inspectors attached to the office of the Pennsylvania Department of Mines have been instructed by Governor Sproul to make visual inspections at the mines with regard to the quality and preparation of anthracite now being produced. This procedure was suggested by the Federal Fuel Distributor as a speedy and effective measure, in view of the familiarity of these inspectors with anthracite and the standards of its quality as shipped. The Federal Fuel Distributor has been informed by the Anthracite Coal Operators' Association, of Philadelphia, that all members of that organization have been urged to conform immediately to the Fuel Distributor's requirements in the preparation of anthracite. This association controls about 85 of the so-called "independent" companies producing approximately 50 per cent of the "independent" tonnage.

Continuation of the present policy of requiring the mining of a minimum amount of coal at each operation on leased government lands in twelve Western states, taken into account with the production of mines now operating on private lands, promises to result in a total annual coal-mine capacity in that region of 80,000,000 tons within two years, declares H. Foster Bain, Director of the U. S. Bureau of Mines, in a memorandum submitted to the U. S. Coal Commission. As the maximum war-time market for coal from these states was 40,000,000 tons per year, the large production increase seems certain to bring about the same unhealthy condition, the same loss of capital, and the same distress among miners in the Western coal mining industry that was so marked a feature of 1921 in the coal industry of the East and Middle West. "The general leasing law of Feb. 25, 1920, is mandatory so far as requiring the Secretary of the Interior to divide the land into leasing blocks is concerned, but it apparently permits his discretion as to when and by what general method leases shall be granted," states Director Bain. The states affected by the coal-leasing program are California, Colorado, Idaho, Montana, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington and Wyoming. Coal is produced in Alaska under the provisions of separate legislation.

Association Activities

Winding Gulf Operators' Association

E. E. White, of the E. E. White Coal Co., operating in the Raleigh County field of West Virginia, was re-elected president of the Winding Gulf Operators' Association at the annual meeting of the association held at White Sulphur Springs on Dec. 12. This is the fourteenth consecutive time that Mr. White has been chosen to lead the association. Other officers elected were C. H. Mead, Beckley, vice-president; A. W. Laing, MacAlpin, treasurer; George Wolfe, of Beckley, secretary.

Topics engaging the attention of the meeting were car allotment and distribution and car shortage. J. R. Cary, general superintendent of the Eastern division of the Chesapeake & Ohio; S. M. Adsit, traffic manager of the Virginian, and W. H. League, chief car distributor of the Virginian, were present and discussed the above questions. Other guests were George H. Bailey, of the American Mining Congress, of Washington; W. A. James, secretary of the Beckley Chamber of Commerce; Charles Hodel, editor of the Raleigh Register, and William MacTaggert, agent of the Beaver Land Co.

A luncheon was held at the Greenbrier Hotel at the close of the business meeting.

Trade Literature

Westinghouse Electric & Mfg. Co., of East Pittsburgh, Pa., has issued a 20-page booklet, folder 4506, entitled **"Salient Facts on Silent Gears,"** describing the advantages of the use of Micarta gears and pinions. The booklet is well illustrated and contains gear data which enables the gear user to judge whether they are applicable to his machinery.

Small Reinforced Concrete Coaling Plants. Roberts & Schaefer Co., Chicago, Ill. Bulletin 49. Four-page folder showing views of one-track coaling plant, Simplex skip bucket and loader.

Coming Meetings

American Engineering Council will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northeast Kentucky Coal Association will hold its annual meeting Jan. 23, 1923, at the Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

The Stonega Coal Pile—

your never-failing source of supply

Not only are our mines non-union and thus able to continue operations during strike disturbances, but we are equipped far better than the majority of coal companies to meet the demands of our customers.

One of the plans we put into effect to meet the excess demand during the war still continues to function. Our central storage yard, capacity approximately 125,000 tons, is an inexhaustible source of supply to our customers.

The low-sulphur contents of Stonega Coal is demonstrated in its adaptability to storage purposes. At different times this pile of coal, thirty feet high, remained untouched during the most extreme weather conditions. Surprising as it may seem, the change of temperature throughout the pile, during this time, was barely perceptible. This fact was definitely established by means of a system of piping extending into the pile at stated intervals and temperature readings taken frequently.

Some vitally interesting facts are to be found in the Stonega Booklet. *Mail the coupon today for your copy.*

Coal Age

Responsibility

How do you conduct your business? Do you attempt to do everything yourself, look after a thousand and one details, be at the same time both executive and detail man, be personally responsible for everything which happens around the plant? Or do you seek out able assistants and place the responsibility for the different departments of the work upon them, leaving the manner in which they are to execute their assignments strictly up to them? No one need tell you which method is the better.

Why not, then, do the same with your fuel problem, choosing instead of a single individual an organization trained to handle the specialized details of this business in a highly efficient manner? International service is supplying the needs of hundreds of the large coal and coke users thru-out the country, assuming the responsibility of giving them the grade of fuel they need, in whatever quantity they specify, and maintaining the service uninterrupted so far as humanly possible.

Put the responsibility of meeting your *fuel* problem up to us.

It takes all kinds of people to make a world

Nineveh Shaft

YES, and many kinds of conditions to make up the mining industry — mines with a forest of props, behind and among which miners play hide and seek as they shovel coal into a car, and mines with the roof like a bell that stands up without propping, seams thick and thin, workings gasless and gassy and so forth. For each condition there is an appropriate solution. The one the working to suit which is made the subject of Mr. Cornet's paper in next week's *Coal Age* is not one of either extreme. His plan is suited to roof such as is likely to be found in many American mines and is based on the practice he has found established in Belgium.

ANOTHER article describes the Nineveh Mine, at Seward, Pa., where solid cars are hoisted in self-dumping cages. As a result of the stiffness that the use of steel and the absence of a gate confers it has been possible to provide a capacity of 1½ tons in a car that affords 12 in. of headroom in a seam 3 ft. 8 in. thick. More and more is emphasis being placed on a big car as a tonnage producer. Electric gathering locomotives, better bearings and wheels, car bodies that hold their shape and straight steel room tracks are making the big car popular with the miner and operator. It is no longer a questionable expedient.

SOME PEOPLE have wanted to know if we could not use German brown-coal methods for the manufacture of briquets. O. P. Hood, chief mechanical engineer of the U. S. Bureau of Mines, will tell in next week's issue, why it cannot be done. German brown coal has its own binder and, by the way, for most of it little else commendatory can be said, for it is a badly watered stock. Only one-third of it is consumable. Mr. Hood's article is quite readable and summarizes facts, some of which, at least, were known back in the first decade of the century to the Technological Branch of the Geological Survey.

IT USED TO BE thought well to ventilate stacked coal and keep it cool. Now we tend to do the reverse, pack it tight, knowing that where air is excluded coal will not burn. In the tight seam under tons of rock the coal has kept from ooo to ooo and generation to generation free from spontaneous combustion, even though the internal fires of the earth, intrusions of molten matter and the heat of mountain-forming movement warmed it. It could not burn so long as it had no air. A Philadelphia electric company has found a way to compress the coal in a stockpile so that it is nearly air-free and therefore largely fire-free. Read what it has to say next week.

$2,000 saved driving a blind entry—

This little book not only tells how an eastern coal mine saved $2,000, but it tells you how any coal mine can save thousands of dollars on new development work by using Flexoid Tubing.

Whenever blind entries, air courses, tunnels and shafts are contemplated—or wherever gases will not clear—Flexoid Tubing connected to an auxiliary fan is an extraordinary labor saver, time-saver and life-saver.

The Flexoid System consists of a flexible, pliable treated canvas tubing and a fan directly mounted on the armature shaft of a motor. Flexoid Tubing is suspended from a wire strung on posts. 500 feet of Flexoid can be installed by one man in two hours.

Write for your copy of "$2,000 Saved" today.

Mankato, Minn., U. S. A.

The Most Economical Method of Firing Bituminous Coal

More perfect combustion, more steam from less coal, less work and less upkeep are results of the coking method of burning bituminous coals.

The Marion Hand Stoker is designed for bituminous coals and this method of firing. After distilling volatile at the front of grate the coke is moved uniformly forward by a gentle stoking action.

Free air action is allowed through the fuel bed by uniform air spaces in the grate, proportioned to prevent loss of any unburned fuel.

Stoking of the fuel is a continuous forward movement every time the bars are rocked. Marion Hand Stokers are easily and quickly installed without alterations to the boiler front. Bars cannot warp or twist.

THE BREADTH OF ECONOMICS

AN old word with a new meaning has been introduced into the affairs of men. The power of words is very great and an understanding of them is one of the essentials to progress.

¶ The advancement of humanity hinges, to an almost menacing extent, upon a complete conception of the word *economics*. Once popularly confined to finance, it has grown to involve the whole realm of human activity.

¶ Now man is the economic factor in the work of the world. Whatever he does, the result—time, effort, ability and resources engaged—must prove up under the standards of economics, or be judged unworthy.

¶ But who has brought about this change, this revision in the conception of man's advancement, of man's inevitable responsibility? And who has given this word so vast a power over human destinies and has caused so gigantic a revolution for the benefit of all humanity?

¶ The engineer. His is the responsibility. He it is who has introduced economics into all the affairs of men. He it is who has provided the world with a new basis for judgment and appreciation.

¶ The engineer, who has made life assume a scientific instead of a chaotic aspect; who has developed an exactness of procedure; who has worked out cause and effect on a calculable basis; who is even now reducing the fever of misapplication of life's priceless energies and putting them to the service of constructive happiness.

¶ It will be many generations before the mass of humanity knows and acknowledges its debt to the engineer, who so quietly brings about such stupendous revolutions and revelations, and who takes the past and links it to the present for the benefit of the future.

¶ Yet while the acknowledgment may be long in coming, the engineer has his reward in the knowledge of work well done, in the joy of accomplishment, in the feeling of power which gives him the opportunity to direct the courses of men even before they are aware of the source of authority.

FROM GILBERT'S

DE MAGNETE —

"WORD MONGERS" *and* "CHATTERING BARBERS"

"Word mongers" and "chattering barbers," Gilbert called those of his predecessors who asserted that a wound made by a magnetized needle was painless, that a magnet will attract silver, that the diamond will draw iron, that the magnet thirsts and dies in the absence of iron, that a magnet, pulverized and taken with sweetened water, will cure headaches and prevent fat.

Before Gilbert died in 1603, he had done much to explain magnetism and electricity through experiment. He found that by hammering iron held in a magnetic meridian it can be magnetized. He discovered that the compass needle is controlled by the earth's magnetism and that one magnet can remagnetize another that has lost its power. He noted the common electrical attraction of rubbed bodies, among them diamonds, as well as glass, crystals, and stones, and was the first to study electricity as a distinct force.

"Not in books, but in things themselves, look for knowledge," he shouted. This man helped to revolutionize methods of thinking—helped to make electricity what it has become. His fellow men were little concerned with him and his experiments. "Will Queen Elizabeth marry—and whom?" they were asking.

Elizabeth's flirtations mean little to us. Gilbert's method means much. It is the method that has made modern electricity what it has become, the method which enabled the Research Laboratories of the General Electric Company to discover new electrical principles now applied in transmitting power for hundreds of miles, in lighting homes electrically, in aiding physicians with the X-rays, in freeing civilization from drudgery.

General Electric

General Office Company *Schenectady, N.Y.*

They thought it would —but it didn't

When the concern that had us build this tank way back in 1891 ordered it they thought of course it would need some repairs in a few years. But it has fooled 'em. Recently we put some up-to-date hoops on it—the only expense in 31 years. Typical H-S Tank service.

SURE GRIP

Just Out!

Bituminous Coal Mine Accounting

By T. S. Reed, formerly secretary of the National Coal Association, consulting accountant, formerly auditor for the Rock Island Railroad, the Illinois Coal Operators' Association, and the Bituminous Coal Committee.

221 pages, 6 x 9, 67 forms, $3.00 postpaid

A uniform cost-finding system for bituminous coal mines

THIS book has grown out of the universally recognized need for a system of accounting and cost-keeping which could be applied throughout the bituminous coal mining industry. It is the work of the former secretary of the National Coal Association, who was selected for that post to direct the construction of the uniform cost-keeping system which this book describes. The system recommended by the Cost Accounting Committee of the Association is set forth in detail and with numerous helpful forms.

A Summary of Contents

The book opens with a very comprehensive discussion of the accounting forms required by governmental authorities, as well as those which are recommended by the various coal mining bodies of the United States Government.

Succeeding chapters deal with the accounting record, the pay roll record, and the records of product and distribution. The many forms are explained, followed by chapters on accounting for expense, for power, supplies and purchases, and for depreciation of property.

A lengthy chapter is given to the subject of accounts to which the various items of the profit and loss statement are charged. The closing chapters contain several valuable miscellaneous forms.

The subject of depreciation is handled with great thoroughness and the various methods for proper appropriation to the profit and loss account are explained. Other important subjects, including the treatment of royalties, are discussed, and each paragraph set forth in such a manner that it is readily understood by a reader not familiar with the subject. The book can be used as a text book on the subject.

The number system is flexible in detail and the complete chapter is arranged so as to facilitate the handling of the books with a minimum of clerical work.

OHIO
MINE CAR GREASE

OHIO
Mine Car Grease

is the ideal lubricant for car wheels inasmuch as its composition renders it immune from the destructive action of mineralized water.

The wheels of a mine car, perhaps more than any other, are subjected to repeated stresses and strains and, therefore, require the greatest degree of lubrication.

OHIO MINE CAR GREASE is particularly adapted to these trying conditions. It has been checked by our own engineers who have observed lubricants at work on all types of wheels, plain, ball or roller bearing, in all kinds of mines, from the smallest to the largest, all over the country; when they recommend a particular grade—you can rest assured it is the best suited to your individual requirement.

Expert Service Without Cost

REALIZING that your production costs can be reduced by overcoming friction losses, we maintain what is probably the most proficient consulting staff of lubricating engineers in this country to help you solve your lubricating problems.

These men are first of all good mechanical engineers but some of them are mining engineers of distinction as well. Understanding completely, the function and operation of every piece of machinery in your plant, from the huge, humming power-generating dynamos, to the smallest, chattering air drills, they are well qualified, both by experience and training, to advise you regarding correct lubrication.

Being absolutely free, the services of these men should be used frequently by you. You may consult them regarding only one motor or machine, or they will investigate your entire plant and recommend the correct lubricant for each item.

While these men are experts themselves, to confirm their decisions they have behind them the experience of this company, extending over a third of a century, in manufacturing oils and greases for the efficient and therefore economical lubrication of possibly every conceivable type of machine.

These lubricants are guaranteed by us. Our experience has guided the selection of the materials used in manufacturing them and our laboratories have taken the finished products and by actual working tests proved them to be perfect for the work to be performed.

If you have lubrication problems, avail yourself of this expert service offered to you without cost. You will find it a pleasure to do business with such men as these, not as many other operators are found with them throughout. A card addressed as this ad is, to the nearest station to you will bring immediate action.

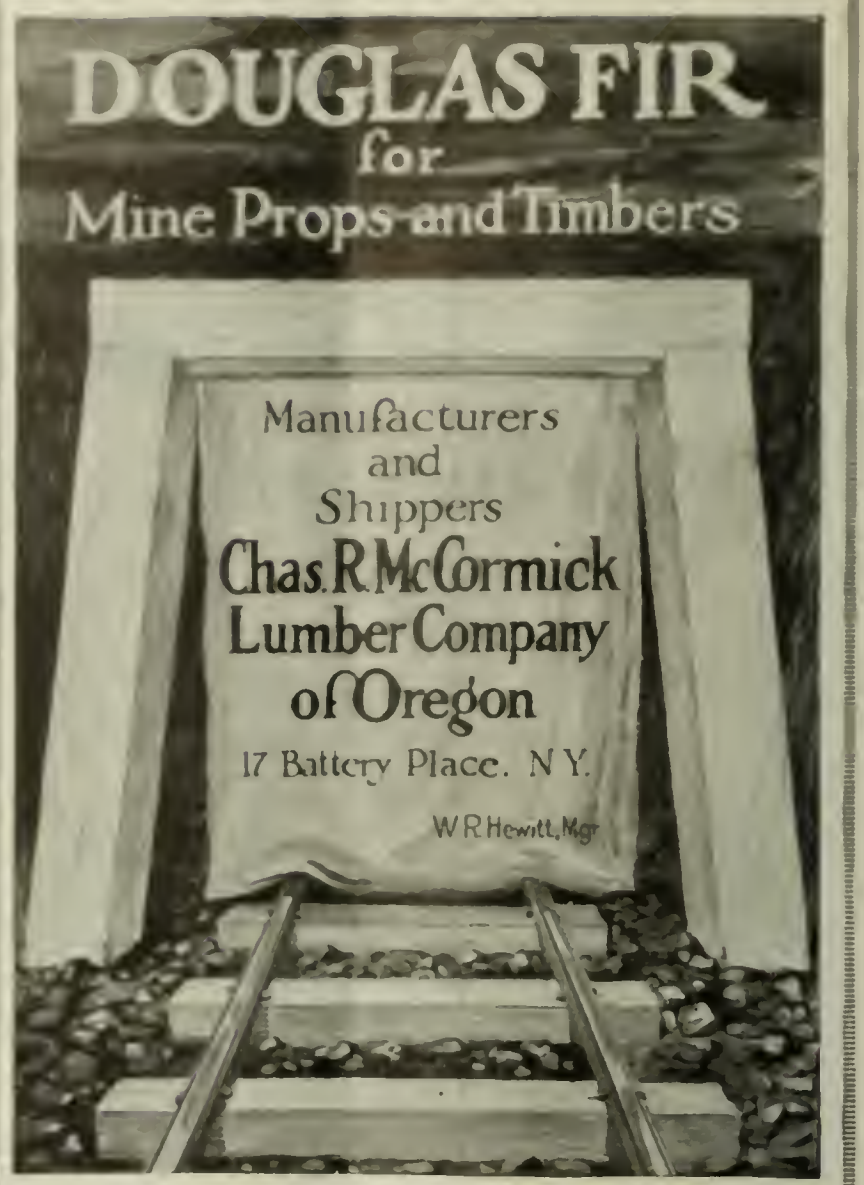
Reid Safety Frog

Style "B" Bolted to Rail

It is as easy to lay the Reid Safety Frog as it is to lay a rail. Just level up the bed, spike and bolt in place—nothing to change—no special tools.



The only replaceable working parts are the two manganese steel wearing members.

Illustrated price list and data for installing Reid Safety Frogs.

Leschen Mine Hoisting Ropes

Leschen Wire Ropes for mine hoisting are furnished in both Round and Patent Flattened Strand constructions and in different grades of material. For heavy work we recommend Hercules (Red-Strand) Rope. Every Leschen rope is rigidly tested to insure constant uniformity.

Weir TITAN Frogs Are Trouble-Proof

When you install Weir TITAN Frogs in your mine tracks you relieve yourself of all trouble previously due to loose, rattling, unstable frogs. Why? Because Titan Frogs are cast in one solid piece as illustrated below, from titanium steel. They fit standard rails of all weights and when securely bolted into place are proof against breakage from any ordinary cause. In point of service TITAN Frogs are by far the most economical.

Our Catalogue fully describes the entire line of Weir track equipment

TRADE MARK

Sensible Buying

The well-known principle behind all purchasing is that of securing best possible value. With this in mind we call your attention to "Cincinnati" Track Equipment as being thoroughly adapted to your needs and affording maximum service per dollar spent. Full particulars will be sent on request.

Ground Throw with Spring Connecting Rod.
In two sizes. Type ASD2 for 12 to 35 lb. rails and DLSD2 for 40 to 50 lb. rails.
Made of malleable iron, die formed and forged steel.
Switch points prevented from breakage.

The "Cincinnati" Frog & Switch Company
Cincinnati, O.

"CINCINNATI"

Get Preferred Attention—Mention Coal Age in Writing Advertisers

Speed is important

Now, if ever in the history of coal mining speed is important. A huge handicap must be overcome if every one passes the winter in comfort and industry does not feel the pinch of fuel stringency.

And not the least among the factors by which speedy production may be obtained is your tracks and the switches, frogs, crossings, switch stands and turnouts that contribute to their safety.

See that all extensions and renewals includes Central Mine Track Equipment. This is not a time when anything short of the best can be relied upon.

Call "Central" and ask for "Information"

Haulage rope Break? No matter!

Absolutely no danger in this new Prockter Safety Car. The heavier the load and the steeper the grade, the tighter the brake will hold

It works by means of friction. Two extra ropes are laid throughout the entire length of the incline. At the top these are attached to a concrete foundation; at the bottom they are weighted. Within the mechanism of the car these ropes are guided around a V-grooved pulley. The brake is applied to this main pulley either automatically by means of a governor or by a hand wheel.

Send for your copy of the new Prockter Bulletin.

B & B Aerial Tramways Keep the Coal Moving

from mine to railroad without a hitch. Dump your slack automatically in midair. Increase your output. Lessen your labor. Installation costs are remarkably low; so is upkeep. Stoutly built. Carry on for years with few renewals.

When fall is sufficient, gravity supplies power. Operate also on steam, gasoline or electricity. Our Friction Grip or Two-Bucket Types built to order. Latter requires but one attendant; former seldom more than two.
